For fungus infections

● Prevalent under conditions of overcrowding, fungus infections may spread with the Summer growth of facilities for sport and bathing. 'Mersagel' jelly is already established for the treatment and prophylaxis of such ringworm conditions as 'athlete's foot' and dhobie itch. 'Mersagel' consists of phenyl mercuric acetate—a powerful fungicide in a water-soluble jelly base. Its fungicidal powers in other sites than the skin (e.g. vaginal mucous membrane in monilia vaginitis*) have been favourably reported upon.

★ *Investigation and Results of Treatment of 1,000 cases of vaginal discharge. B.M.J., 1, 509, 1945 (April 14th).*

Origin of a 'household name'

WRIGHT'S LIQUOR CARBONIS DETERGENS

The antiseptic and antipruritic constituents in Coal Tar were isolated for the first time when Wright's introduced their active extract Liquor Carbonis Detergens over 80 years ago. This distinctive preparation has secured a prominent place as a medicament in treatment of skin diseases. It is specified repeatedly by leading dermatologists and is today, through constant research and the application of modern methods of manufacture, a better product than ever before, both in appearance and antiseptic value.

Wright's Coal Tar Soap, generous in lather, soothing to the tenderest skin, derives its health-protecting powers from this preparation.

OVERNIGHT EVACUANT

"There is a time for every purpose," and Nature has appointed the hours of night as the time for rest and recuperation. Making these hours coincide with the taking of an evacuant has sound psychologic as well as therapeutic justification if the medication does not interfere with the salutary effect of unbroken sleep. In the case of Agarol the patient is hardly conscious of having taken an evacuant. There is no unpleasant after-taste, no griping; and there need be no fear of an untoward premature result, for Agarol acts with almost clock-like regularity, allowing eight hours from the time of taking to the time of evacuation. Agarol is a mineral oil emulsion with a small dose of phenolphthalein.

Dale Street, Town Clerk.
Liverpool.
August, 1946. (1595)

MINISTRY OF HEALTH

Applications, from qualified Tutors, male and female (including those who have recently retired) are invited for posts under the Ministry of Health to train men and women, who have had nursing experience in the Services, for the preliminary and final examinations of the General Nursing Council for England and Wales.

The General Nursing Council for England and Wales has agreed that the course of training of these men and women will take one year and will be held at special centres in England and Wales. The tutors will be responsible for supervising the students' progress and for the theoretical part of their training, which will be carried out at the centres, the practical part being taken in neighbouring hospitals.

The posts will be temporary and will be for a year in the first instance. Salary will be according to the Rushcliffe recommendations.

Applicants should state their age, qualifications, experience, and present employment, and should say when they expect to be able to start.

Applications should reach the Director of Establishments, Ministry of Health, Whitehall, London, S.W.1, before September 16th, 1946. (1633)

JOURNAL OF THE ROYAL COLLEGE OF NURSING

Nursing Times

VOL. XLII. No. 33 SATURDAY, AUGUST 17, 1946

EDITOR: MISS K. F. ARMSTRONG, S.R.N., S.C.M., DIPLOMA IN NURSING, LONDON UNIVERSITY

American Pattern

THE Committee on Medicine and the Changing Order, set up by the New York Academy of Medicine in the winter of 1942, has just published a monograph on Nursing and Nursing Education by Agnes Gelinas, R.N., A.M., which will prove of great interest to all nurses here who are alive to the development of nursing as a profession in this country. It brings out the similarities and the differences in the problems we have to face: the directions in which they are ahead of us and those in which we are ahead of them: and the vast common ground on which we both have to push forward with all the determination to succeed that is at our command—and here it gives some valuable suggestions that we should follow.

The Committee on Medicine and the Changing Order is made up of medical men, members of the allied professions of dentistry and nursing, and laymen. It consists apparently of fifty persons, the majority doctors with three members each from the nursing and dental professions, and seven laymen. We are glad to see that the nurses names carry the letters R.N. after them: nurses here often neglect to use their professional letters, even when they are elected to serve as professional representatives on committees of this nature, and it is a great pity. If we want others to respect our profession we must show that we ourselves are proud to belong to it—it may be forgetfulness which causes the letters S.R.N., to be omitted so often—it may be a false humility or the inferiority complex that has done and will do so much harm to the profession here unless we get the better of it. It is a healthy sign for the recognition of American nursing that nurses were invited to sit on this Committee, even though their representation was comparatively small—in this country we so often work apart as though our problems were unique, to the detriment of the service that we render to the public.

The New York Academy of Medicine (this corresponds roughly to the Royal Colleges in this country) which set up the Committee, charged it with the task of reviewing the nature, quality and direction of the economic and social changes that are taking place and are likely to take place in the immediate future; and particularly to define how these changes are likely to affect medicine in its various branches; and to determine how all that is best in the science and art of medicine could be preserved and extended to meet such new social patterns as may appear. The objectives of the Committee were to explore methods of maintaining and improving the quality of medical service: to study the means of making the best practice in preventive and curative medicine available to larger numbers of people and to the country as a whole: and to explore the possibilities of distributing these services, not only to a larger number of people, but at a lower cost per head, than under the present system. The Committee held weekly meetings at which experts from various fields such as economics, industry, labour, politics, medicine, dentistry, the hospitals, nursing and social work addressed the Committee and discussed their points of view with them. The Committee also, early in its career, enlisted the help of a number of experts to produce a series of monographs, of which this is one. The monographs are historical in character and are intended to bring to light not only the achievements, but also the inadequacies in present-day practice, the uneven development, the irrationalities and the lag in the adjustment of medicine to the social needs of the day.

Miss Gelinas is to be congratulated on the work that she has done. She is well qualified to present this concise picture of the development, achievements, shortcomings and future of the nursing profession: she is professor of nursing and chairman of the Skidmore College Department of Nursing in the New York Post Graduate Medical School and Hospital. There is a short preface by Mrs. Agnes Belmont, a member of the Committee, who points out that in America—and it is, perhaps, even more true of England—there is an increasing demand for nursing service by the public and an assumption that that service will be available whenever the public wants it, without serious consideration of the source of supply, the relationship between supply and demand, the living and working conditions of nurses during and after training, the selection of suitable candidates for the profession and the quality of the education and training these candidates receive. How true it is here that the general public seem to think that a National Health Service with hospital and home nursing services for all can be made available by an Act of Parliament without serious consideration of all these points by the public and without support for every measure which will secure *more suitable* recruits in *larger* numbers for a *better* training.

Miss Gelinas, in a short introduction, points out that there has never been so much attention focused on nursing in America as there was at the time of her writing: for her book was largely written during the war when the importance of nursing was intensified and the Government of the United States of America had spent large sums on nursing education and had been responsible for the Cadet Nurse Scheme. She emphasizes the comparitive youth of nursing as a profession, but claims that it "now has a place of first importance in the field of human endeavours." Can we substantiate that claim here? We certainly shall say "should have", and should not be content till we can say "has," without the suspicion of a doubt—the flicker of an eyelid. But she askes for more interest and research, since there must

Miss Anna Wolf, Director of Nursing Services and School of Nursing, Johns Hopkins Hospital, Baltimore, U.S.A., in her office, with Mrs. E. O. Jackson, R.R.C., matron, and Miss M. Houghton, O.B.E., senior sister tutor, University College Hospital, London, who have just returned to England after visiting leading schools of Nursing in the United States and Canada (see Nursing Times of July 13, page 534)

An epidemic of typhoid, reported from Aberystwyth, has thrown an extra burden on the Isolation Hospital there. **Above :** *Miss Mair Davis, matron (second from left) with some of her nurses, preparing to deal with emergency cases.* **Right :** *extra beds and mattresses being unloaded at the hospital*

be a comprehensive plan for the nation which aims to provide a more efficient nursing service. She admits that the nursing profession is aware that reforms are needed both in education for nursing and in nursing service, and concedes that we must expect the public to be more interested in the nursing service that it gets than on nursing education. " It wants good nursing," she writes, " but it does not concern itself too much with what makes a good nurse." Of course, she goes on to point out that, " the first requisite for competent nursing care is sound education; reform in one is dependent upon reform in the other " : and after discussing the fundamentals which must be included in the basic professional training she goes on to state that " the importance of nursing education in relation to nursing service must be more widely publicized." In this country even the medical profession has to some extent to be converted to this point of view, and the general public is woefully ignorant. The average layman thinks of the hospital nurse solely as an underpaid employee and does not realize that she is a *trainee*, obtaining a professional education, and that the hospitals offer permanent posts to a very small number of nurses only. This fact the nursing profession must certainly continue to publicize.

The substance of Miss Gelinas' monograph consists of six chapters dealing with the development of nursing as a profession, nursing supply and demand, personnel policies and the maintenance of standards, nursing education, estimated nursing supply and demand in the post-war period, and building the future of nursing. Space will not permit us to discuss them all fully and we do not propose to do so, as we hope large numbers of British nurses will read the book themselves. There are, however, two points concerning nursing to which we should like to refer to-day, and next week we shall discuss the references to the chapter on nursing education. What is obvious from a study of the text is that, in some of its training schools at least, America is definitely ahead of us educationally, giving a more comprehensive and scientific training to the student nurse on a student basis. On the other hand we both have the problem of shortage of suitable candidates, and shortage of trained personnel in the hospitals, particularly in the special fields of mental and tuberculosis nursing. Here we have some advantages which American nursing will find it more difficult to obtain—a national salary scale, a recognised training for the assistant nurse, and some protection for the title " nurse." These things can scarcely materialize so readily in the United States of America, because of the vastness of the country and varying conditions.

With regard to supply and demand Miss Gelinas gives figures showing the distribution of registered nurses in 1941 and 1943. In the United States 47 per cent. were in institutional nursing, 27 per cent. in private duty nursing in 1941; 10.3 per cent. were in public health, 3.2 per cent. in industrial nursing and 10.2 per cent. in " other or unknown " work. In 1943, 45.5. per cent. were in institutional nursing, 26 per cent. in private duty nursing, 11.1 per cent. in public health nursing, 6.6 in industrial nursing and 10.8 in " other or unknown " work. The fact that one quarter of the trained nurses available were looking after private patients—very often caring for one patient only, in the hospital rather than at home—at the time of national emergency when there was a shortage of nurses for general duties in the civilian and military hospitals, brings up a problem which this country has also to face. Should not more of these nurses be looking after more than one patient when there are other patients who cannot be admitted to tuberculosis and other hospitals ? Miss Gelinas suggests the sharing of the nurse between two or more patients according to the degree of their illness as a means for making the available nursing strength go further than it does. America also has, it seems, to face the problem—which is so acute here—of attracting trained nurses to work as regular members of the hospital staff—the Americans call them general duty nurses.

In probing the problem of obtaining adequate staff for the needs of the population—such as, for example, the needs of the tuberculosis hospitals in this country to-day—Miss Gelinas makes an important suggestion which we cannot claim to have carried out satisfactorily. " The leadership of the director of the school of nursing and the teaching faculties is important in preparing students for work after graduation and in interesting them in the various opportunities in nursing." If, she argues, the teaching personnel—the matrons and sister tutors, and ward sisters too—themselves know the local, regional and national nursing needs, it should not be too difficult for them to make the senior student nurses familiar with them and inspire them to accept the challenge to meet the most urgent of them. Can we claim that we have done this here ? Up till June of this year the State made it a duty of the young nurse to help to meet the most urgent national needs. Now our young nurses leaving hospital are free to choose: have the leaders inspired them with a desire to know where they are most urgently needed and the spirit to go and offer their services ? This is an angle for everyone to consider.

Topical Notes

Morals From Aberystwyth

THE story of the occurrence of typhoid fever among people who had eaten ice-cream from a single barrel at Aberystwyth has its morals. The first patient was admitted to hospital on July 27 : in under three weeks there were over 100 cases traceable to the same barrel of ice-cream. The man who made and sold it had a positive Widal test 1.320 and a test against the VI antigen of the typhoid bacillus was also positive—1.80; he had had typhoid in 1938 and the bacteriological findings suggest that he is still excreting the Bacillus typhosus. The milk and water supplies in the area produced negative results. We hope that publicity will be given to the lesson that even with clean milk and water, those responsible for handling food must have adequate medical follow-ups after any infectious disease—and this requires co-operation from the patients as well as the medical personnel. There is also a need for those who handle food to learn to be completely clean in their habits—wash their hands carefully after every visit to

the lavatory—facilities for this should be provided or there will always be a possibility that infections such as typhoid fever spread far afield. In this particular instance the infection is not likely to be limited to one area—already there are cases in Lancashire and Northamptonshire—for Aberystwyth is a popular holiday resort. It has been reported that penicillin is being used in a new way. The results will be interesting, for until now it has proved disappointing.

For Greater Protection

PROFESSOR W. H. Tytler, a member of the deputation which approached the Ministry of Health recently (see the *Nursing Times*, Aug. 3rd, page 582), asking that the Ministry should take steps to ensure supplies of B.C.G. for vaccination against tuberculosis has written to the *Lancet* to draw attention to a new development of possible importance in this connection. Russian scientists claim to have discovered a method of freeze-drying which yields a product that will retain its immunizing efficacy for at least 18 months. A major difficulty in production of B.C.G. vaccine has been that it must be used within a few days, before tests for virulence, or for the presence of virulent contamination bacteria can be completed, which makes necessary the most rigid supervision and complicates the methods of production. If it can be stored while tests are carried out, production can be simplified, larger quantities produced and more uniform results ensured. This discovery should prove of great value to the nurse who is Mantoux-negative, for work in Norway during the war suggested that a Mantoux-negative nurse who contracts the disease, but has not been offered vaccination, may well have a case for damage against her employers. Employers cannot offer vaccination, however, until the vaccine is available and anything which will facilitate the production of larger and safer supplies will bring protection to the contact in the hospital or the home nearer.

After Five Years

SOME of the delegates to the Conference of Paris—the peace conference—will, surely, be thinking this week of an August 14 five years ago, when the world first saw the hopes for peace which the two great war leaders, President Roosevelt and Mr. Churchill, embodied in the Atlantic Charter. The difficulties of achieving peace to-day may seem no less than in 1941, but at least the nations of the world are on speaking terms: words not guns display their feelings and minds are tuned to harnessing ideas to world order instead of world disorder. Another important conference is going on at Geneva—the Council of UNRRA is in session. This year was to have been its last, but various countries—Czechoslavakia, Russia, Poland, and less directly, Albania, Greece and Italy, are appealing for its continuance. Major problems remain unsolved—there are still 830,000 displaced people and it will be perhaps years before nutrition, housing and clothing are satisfactory. It would seem a pity to waste the experience of UNRRA's many technical officers before the problems show signs of solution, but the financial aid from contributor countries does not appear to be forthcoming: governments think it right to put the interests of their own countries first.

For Positive Peace

ADVICE will soon be available from another quarter. The various organs, committees and commissions of the United Nations' Organization are taking shape. The Food and Agriculture Organization is holding its secondary plenary session in Copenhagen on September 2, but although it will have much to say on the co-ordination of supply and demand, if it is to undertake UNRRA's tasks with regard to the distribution of food, its constitution will have to be amended. Money still forms the basis of most activities and the meetings now taking place in London of U.N.O.'s Sub-Committee on the Economic Reconstruction of Devastated Areas will we hope, be able to form the basis of healthy and prosperous life. Field teams from this subcommittee are visiting Europe and will submit reports of conditions early next month. They may not form happy reading but they will at least show an awareness—an awareness begun for many of us in the Atlantic Charter. As we go to press we hear that U.N.O.'s International Refugee Organisation has well advanced plans for taking over in January and recruiting qualified UNRRA personnel.

Higher Pay

THIS week we conclude our extracts from the revised Rushcliffe scales of salary contained in the Nurses Salaries Committees' Notes No. 12. Next week we shall publish the revised scales for mental nurses, men and women, contained in Mental Nurses Salaries Committee's Notes No. 7. They refer to the higher posts such as those of matrons, chief male nurses and sister tutors. Matrons of hospitals which are training schools and have over 1,330 beds will receive salaries from £680 to £900, including emoluments to a total value of £250. This week the National Joint Council for Staff of Hospitals and Allied Institutions in England and Wales has adopted a new scale of wages and conditions of service for "domestic employees" in the mental health services and mental deficiency institutions. The rates will be 8s. a week higher, for all categories, except 'tradesmen' than those recommended earlier in the year for hospital domestic workers generally and, like these, will have effect from the beginning of the pay week in which April 1, last fell. Tradesmen will receive not less than the trade rate with additional pay on instructional duties.

Matron for Palestine

Miss Bonthron with the King and Queen during their visit to the Birmingham Accident Hospital last autumn

WE congratulate Miss M. O. C. Bonthron, matron of the Birmingham Accident Hospital on her appointment to a new post—that of matron-in-chief, Health Department of the Palestine Government. As we go to press the news from Palestine concerns barbed wire, gun emplacements and airborne forces which unhappily point to the need for strong nursing services: The Government's idea in creating this new post, no doubt is to help Palestine help herself. Miss Bonthron takes with her varied experience: a trainee of St. Bartholomew's Hospital she first took her fever training in Scotland; she is also a State Certified Midwife, holds the Diploma in Nursing of the University of London and is an examiner of the General Nursing Council. Having held appointments as matron of the Radcliffe Infirmary, Oxford and as travelling secretary to the Nursing Recruitment Centre, Miss Bonthron will take to Palestine a considerable knowledge of the selection of candidates for nursing as well as the efficient organization of teaching nurses. She also has had experience of post-certificate teaching during her matronship at the Accident Hospital.

Faculty of Nursing?

IN THE past two years the Government has increased the Exchequer grant to the Universities from £2,000,000 to £9,000,000. In addition, Mr. Dalton, Chancellor of the Exchequer, has made known in a written answer to a question in the House of Commons, that he has given the University Grants Committee new terms of reference so that there may be "the rapid expansion and planned development of the Universities that the country needs." The number of places for students in our Universities is much smaller in proportion to the total population than it is in the United States of America, for example, and, whereas the standards here may be more uniform, it is vital in this scientific, mechanical age that there should be greater opportunity for men and women capable of benefitting by a University education. The new terms of reference end with the following phrase "to assist, in consultation with the universities and other bodies concerned, the preparation and execution of such plans for the development of the Universities as may from time to time be required in order to assure that they are fully adequate to national needs." In America, the Universities have made room for nursing students, and have definitely helped to attract to nursing those who will make leaders, teachers and pioneers in the nursing world. In this country there is certainly a national need to attract to nursing all who wish to nurse, and to provide facilities suited to their capacities. There is scope for an experimental school within a University at once.

Shoe Sense

THE Board of Trade has put nurses on the priority list for obtaining the limited supply of Service shoes now available coupon-free. These shoes are leather and have no canvas or rubber in their make-up. The Nurses Outfitting Association, Ltd., which has branches in London, Manchester, Birmingham, Liverpool, Southampton, Newcastle and Glasgow has received small quantities of them and they are available to nurses and midwives at a reasonable price. Those lucky enough to obtain these shoes will be most grateful to the Board. For years now nurses have had their work impeded by lack of well-shaped strong shoes and they will rejoice that the work of the Royal College of Nursing and the deputation originated by the Student Nurses Association in their resolution to Council last December has had effect. We must add a hope that soon the supplies instead of being limited will correspond at least to the numbers of existing nurses. In hospitals alone, excluding mental and maternity hospitals there were 87,500 in 1945 and this, of course, does not include the large numbers working in public health.

SOCIAL MEDICINE*

6.—*Industry*

By A. C. STEVENSON, B.Sc., M.B., M.R.C.P., D.P.H., Reader in Public Health in the University of London, at the London School of Hygiene and Tropical Medicine

"Work shyness" may be the result of unsuitable work: Above: selection tests at an Army hospital help service patients to return to civilian occupations which they will enjoy

THE lot of the industrial manual worker at the end of the 19th century was unquestionably hard: if he was sick there was no benefit; if trade was bad and employment scanty, there was no relief, and if this condition persisted for any length of time, the worker was forced to go into the "Poor House," taking his wife and children with him. If trade was brisk, then he was often grossly overworked, and even the advent of machinery did not help him as he had to work too quickly in order to earn enough, and even this was frequently not enough to support his family, so that his wife had to work too. Children, too, were brought into industry, not only the foundlings, but the workmen's own families. The labour of women and children was cheap, and they worked the full working day of anything from 12 to 16 hours, as they worked in teams with the workmen and had to keep them supplied with materials. Small wonder that men grew desperate; some gathered together to try to bargain with the employers for better conditions, others took to drink and bad living. There is terrible evidence of this degradation, and one very distressing fact was the way these parents maltreated their own children. They were made to work from 6 years of age; records show that they were often tied to their parents and slapped to be kept awake; there is even evidence that after a two or three day debauch in the early part of the week, parents kept their children working all night to make up.

Various efforts were made to try to improve conditions as are seen in the long series of Factory Acts from the Health and Morals of Apprentices' Act of 1802, through the legislation appointing Factory inspectors, and the records of their devoted labours, and the limitation of the grosser abuses until the Ten-Hours Bill became an Act and so a Law in 1847.

Social Conscience Awakened

Then there was a progressive improvement in the second half of the century as facts were brought to the light of day by the reports of the factory inspectors, and the report of the Children's Employment Commission. The wastage of human life and the effect upon the morals of the employer and employed were realized, somewhat dimly perhaps, but the full extent of the disastrous results of a century of neglect was only brought home to the public by the report of the Interdepartmental Committee on the Physical Deterioration of the People in 1904. This Committee was asked to go into the question of the lack of recruits for the British Army, and to find why it was attracting such poor types of men into the ranks. This committee went into the whole question of the conditions of the poor, and the public conscience was at last roused. Bad feeding, bad housing, bad industrial conditions all combined to produce drunkenness and moral degradation, and it was found they were gradually sapping each generation in turn, and bringing it lower mentally, physically and morally. Help was speeded up, a minimum standard of living was laid down, Employers' Compensation was brought in as well as the Health and Unemployment Schemes, all of which are now accepted as a matter of course, and are now being extended to the entire population.

Boys go into industry now from 14-16 years of age, all the boy's life will be moulded there, and his morals and standards will be gained in his contacts with the older workers and the management. The 1914-1918 war produced long hours again, and also brought more women into industry again.

This nation is determined on a social revolution; it is not a question of party politics, which are only concerned with the time and method of bringing this about, but all are determined that the nation must be properly housed, properly fed and a higher nutritional level reached. The infant mortality rate must be further reduced, and tuberculosis, which is a preventable disease must be prevented. There must be a lower death rate, and the general health of the people must be improved. These things are essential, and it must be realized that they must be paid for by productive work from all. In the past all efforts have been met by a concrete wall of ignorance and poverty; the people must be educated and co-operate in the raising of the standard of living.

Incentives

Arthur Bryant has said that this present generation is "work shy"; this is largely true, the question is, why? Man is not afraid of work if there is something to work for, either an ideal, an idea, a pride in the work, or pride in himself and his family. That the workers had not inspiring leadership during the years of peace may be one reason, and also industry is rather more stereotyped and therefore, less interesting and satisfying to the worker. There must also be no distrust of management if improvement in the attitude towards work is to be brought about. I am convinced that social improvements and health benefits which are dependent on the brains and hands of the people will be far reaching. Progress in the conditions in industry are vastly improved, and it has been proved that long hours of work do not necessarily produce the optimum output, but broken spells of work and good surroundings do much to ensure a good standard of production. Also it has been proved that by scientific selection, widely varying types of people can be given jobs which they can do well.

Another important point has been realized, that not only must the factory conditions be good, but also the home of the workman must be satisfactory. It was an outstanding fact, that those in charge of handling men in the Services, found that when men "went off the rails" it was nearly always due to home worries, and the worker is not different from the man in the Forces. Social medicine must help in all the aspects of the workers' life, both in the factory and in his home.

One important feature which needs stressing is the welfare of the adolescent in industry. Few people appreciate the great and radical change from being at school to working in a factory. At school the boy works roughly about 27 hours per week under supervision and with help. He has good meals, often provided by the school, and also his play is generally organized and he has organized instruction in the team spirit. In the factory the boy is suddenly expected to work about 45 hours a week, and his meals are more often than not of the "sandwich" type, which

* *Abstract of the sixth of a series of lectures delivered at a Refresher Course for Health Visitors, School Nurses and Tuberculosis Visitors held at the Royal College of Nursing.*

are eaten quickly, and even (though against the rules) eaten in the workroom. The factories in the south, and the newer ones in the northern areas offer better conditions with regard to canteens, but this is not compulsory. In addition, factory discipline is different from the school discipline; it is rather less "fatherly," as the foreman only desires to get a job done well.

Then again, the child is now a wage-earner and must, therefore, be made to work, often receiving inadequate training for the job which in all probability is going to be his life's work. He is often entrusted with expensive equipment and material which is really too great a responsibility for his years, and therefore, the atmosphere is edgy and nervy, not good for youth, and he is liable to form bad habits as a result of these combined conditions. In addition, there may be resentful attitude from the adults with whom the boy works, as he is earning high wages in comparison to theirs, and is sometimes viewed as a possible supplanter. If his work is boring and unsatisfying, and surely the joy of any work is that it is satisfying to the worker, then he will express himself in other ways. Especially in the north boys play rugby or football at school, and this generally automatically stops when the boy goes to work unless he is outstandingly good. It is just about at this age when the true team spirit is beginning to be learnt, and he therefore loses this valuable piece of training. Also his home may not be very attractive; it frequently is not so to a boy about this age, and there he is, bored with his job, not "in tune" with home, but with money in his pocket, obviously liable to get into trouble. It is, therefore, urgent that a new outlook on working conditions should be formed, proper food provided and regular medical inspection instituted. Recent experience of medically examining war recruits was not encouraging.

Women in Industry

One of the saddest aspects of industry in the north is the effect of factory work on young girls. In a few years, many of these girls, so young and fresh when they leave school, become coarsened in face, figure and often speech. Is it right that young women in industry should be cut off from all instruction, and especially instruction in the gentler arts, those which go to making a home? These arts, if labelled "domestic science" do not appeal to girls of 14 or thereabouts, as they think it is just "another lesson." But they can be made attractive to the adolescent, when she is not only realizing she is a human being, but a female human being, it is an excellent time for her to learn. It is not easy for her to be taught in her own home, as frequently the mother is also in the factory or mill, and the type of house is not always adapted for the teaching of better cooking and housecraft. It has already been emphasized that the people must have *Homes*, and not just houses, and this cannot really be achieved if the women of the country are going to be encouraged to go into industry. There is something wrong with our industrial system if a man, doing a good job of work cannot earn enough to support his wife and family. Also, what is the use of trying to teach mothers to breast-feed their children and allowing them to return to industry four weeks after confinement?

Absence from industry due to sickness is increasing; it is possibly due to more illness, longer convalescence, but it is also due to lack of interest in the job on hand. The only accurate information is from industrial records; it is not really sufficiently large to cover the whole population, but it shows that in well-run factories, lost time through sickness was only about half the amount in the less well-run establishments. The Department of Health for Scotland kept records from 1930, and in Scotland the time lost to industry has been increasing, 40 per cent. being due to long-term incapacity, *i.e.*, lasting over one year. This is a very great loss to industry, which regular medical overhauls and longer convalescence could reduce. The Department of Health and medical practitioners on Clydeside have evolved a plan whereby any worker who is frequently unwell, or looks very tired, is seen by the Regional Officer of the Department of Health for Scotland, and convalescence in congenial surroundings has halved the time lost to industry. The Glen-eagles Hotel experiment for miners has already proved that, given good surroundings, suitable exercise and occupation for the mind, a very rapid recovery is obtained. In the Report of the Inter-departmental Committee on the Rehabilitation and Resettlement of Disabled Persons (the Tomlinson's Report) of last year, it was stressed that financial support must be given throughout the illness and the convalescence, and compensation payments should not be influenced by the patient being able to do light work. In addition, training should be given for starting the job again or even training for an entirely new one. It is also important that firms should employ a few handicapped persons, so that they can be wage-earners, not only compensation drawers.

I do suggest that all health visitors and others doing this important type of work, should not neglect to read and discuss the questions of social medicine, or allow themselves to fall behind in current thought. For, as in the past, they should lead the attack on social conditions. Conditions at work should add, not to the sum of human misery, but to that of happiness.

THE GIRL IN INDUSTRY . . .

It is wrong that she should be cut off from instruction in "the gentler arts" of home-making

. . . AND THE BOY

He is passing through a difficult transition stage. If he is bored at work and not "in tune" at home, he is liable to get into trouble

PENICILLIN IN INFECTIOUS DISEASES-2*

By J. L. FLUKER, M.A., M.B., M.R.C.P., Temporary Surgeon Lieutenant Commander R.N.V.R., Specialist in Medicine, formerly Acting Medical Superintendent, City Isolation Hospital, Plymouth

With the use of penicillin in the treatment of infectious diseases, the laboratory becomes an even more important part of the infectious diseases hospital. Penicillin is useless except against a penicillin-sensitive organism. Left: examining specimens in the main bacteriological laboratory at the North Eastern Hospital for Infectious Diseases in London

LAST week the use of penicillin in the treatment of lobar and broncho-pneumonia, streptococcal infections, otitis media and cervical adenitis, tonsillitis, erysipelas, puerperal pyrexia and small pox was discussed and a list given of infectious diseases which do not respond to penicillin

PERTUSSIS is still one of the major killing diseases in babies under one year of age. Unfortunately, penicillin has no effect whatsoever on the uncomplicated case and its main usefulness is certain to be in the treatment of the complicating broncho-pneumonia; a case was described last week (page 604). The treatment of pneumonia in association with whooping cough is less satisfactory than in any other circumstances because death is so liable to result, not from the lung condition but from exhaustion consequent upon the severe paroxyms of the cough, or from nervous complications, notably convulsions.

Diphtheria

Diphtheria is still the commonest disease to be nursed in this hospital and you may be surprised to hear that we have not as yet treated a single case with penicillin. (Sulphonamides, of course, are quite ineffective.) Shortage of supplies is the main reason; for, if clinical research in this type of condition is to be of any value at all, it must be on a comparatively large scale. Nevertheless, we may pause for a moment with profit to consider the essential nature of the disease. The organism lives and multiplies in a local lesion usually in the throat and elaborates a toxin into the general circulation. It is this latter which does the damage by becoming fixed to certain essential organs, principally the heart and nervous system. Once a lethal quantity is thus fixed, death inevitably results and the only remedy which can effectively neutralize this toxin is antitoxin in early and sufficient dosage. No amount of penicillin can do this and the only action that the drug could possibly have would be to accelerate disintegration of the local membrane. In short, penicillin alone in diphtheria **must of necessity, be ineffective**—it must be remembered that about fifty per cent. of untreated cases recover spontaneously—so that antitoxin is always essential. None of the literature that I have read is at all convincing about the benefit obtainable from penicillin though, as remarked previously, more extensive trials are necessary. In the meantime, I would suggest the trial of penicillin after serum has been given in the severer type of case, with thin, translucent rapidly spreading membrane, associated with fast developing oedema and cervical adenitis, which so often seems only partially to respond even to massive doses of serum—in the region of 200,000 units. This type of case is very common in Plymouth. Again, if the local lesion is to be attacked before the system is flooded with toxin, penicillin too must be given early, but I doubt if it will ever play a really important part in the treatment of diphtheria, except the laryngeal variety.

In this latter it has been shown that sulphonamides tend to prevent a secondary and sometimes fatal broncho-pneumonia. As a primary or true diphtheritic broncho-pneumonia is not uncommon it would seem more logical to give penicillin following tracheotomy instead of sulphonamides. The same argument also applies to laryngeal diphtheria occurring as an aftermath in measles, though sulphonamides have been extremely successful. Before the introduction of the latter, the mortality in such cases in whom tracheotomy had to be performed approximated to 100 per cent. Since then, ten consecutive cases operated upon in this hospital by the medical superintendent, Dr. D. F. Johnstone, have recovered. Details of the first four have been published. It should be clear, therefore, that either penicillin or sulphonamides must be given in all cases of measles and laryngeal diphtheria without fail.

Turning next to Vincent's angina and stomatitis, sweeping and at times, even extravagant claims have been put forward about the efficacy of penicillin in treating these diseases, especially in the form of lozenges which are placed in the mouth and allowed slowly to dissolve without being swallowed. Without wishing to decry the results of others, I can only state that I have found such treatment extremely disappointing and that I am not alone in this. Intravenous organic arsenicals, stabilarsan for example, seem a much superior form of treatment, though it is only fair to state that there is lack of unanimity on this point also.

In glandular fever, penicillin has not been used in this hospital, but the number of cases referred here from other institutions in which it had been given provide sufficient evidence of its ineffectiveness; on the other hand, in Weil's disease, penicillin has been used elsewhere, with satisfactory results, it is understood.

Meningitis

A number of important diseases under the collective label of meningitis are now due for discussion. Of these, cerebro-spinal fever is the most important and is a disease of which we have had a good deal of experience in this hospital in all its varieties. Probably, the greatest triumph of the sulphonamides has been in the treatment of this malady, at any rate in all forms save the fulminating types, and including chronic meningococcal septicaemia in which actual meningitis is absent. The mortality here has now fallen to well under 5 per cent. These cases should, I feel sure, continue to be treated with sulphonamides which have the great advantage over pencillin in that they do not require intrathecal administration and, indeed, must *never* be given by that route if disasters, including fatalities, are to be avoided.

There are two varieties of fulminating cerebro-spinal fever, the worse type being well illustrated by the following case :—

Case One.—A boy aged ten was playing football at 3 p.m. on Saturday. At 5 p.m. he complained of a sudden and severe headache. At 7 p.m. he was admitted to hospital and given immediate intravenous sodium sulphapyridine and at 9 p.m. he was dead. Whether penicillin will have any effect on such cases remains to be seen, but it is rather doubtful.

The less severe type of fulminating case usually survives for about twenty-four hours after the onset and this type should

**Abstract of a lecture given at the City Isolation Hospital, Plymouth, to the Ward Sisters' Group of the Devon and Cornwall Branch of the Royal College of Nursing as one of the items of a post-graduate study day.*

receive penicillin if, after eight or twelve hours of sulphonamide therapy, the patient's condition is still rapidly deteriorating. In the case about to be described, there can be little doubt that penicillin was life saving, but before going on to this, a word is necessary about the mode of its administration in meningitis. Unlike the sulphonamides which, following oral administration, almost immediately appear in the cerebro-spinal fluid, penicillin, even following systemic doses in excess of 40,000 units, fails to pass into the fluid through the meninges. In consequence, intrathecal administration is advisable with penicillin as well as administration by the systemic route, as, of course, the inflamed meninges constitute only one feature of a generalized meningococcal septicaemia. When penicillin is given intrathecally, the strength of the solution should not exceed 2,000 units in 1 c.c. of doubly distilled pyrogen free water, obtainable from ampoules, and probably half that concentration is better. The total amount given at any one injection should not exceed 20,000 units and the volume of solution given should always be less than the amount of cerebro-spinal fluid removed. Doses in excess of 30,000 units are liable to provoke symptoms such as headache, stiff neck and other signs of meningeal irritation, convulsions, coma and death. The therapeutic effects of a single dose appear to last for at least twenty-four hours. In conclusion, it must be emphasized that intrathecal injections must not be undertaken with levity and that the most rigid aseptic technique is essential as cases of meningitis have been reported due to the simultaneous introduction of organisms not susceptible to penicillin.

Case Two.—On Christmas Day, in 1945, at 1 p.m., a girl, aged six, was admitted to the hospital with cerebrospinal fever. She had been ill for eight hours before admission with severe headache, sore throat vomiting, together with incontinence of urine and faeces for about three hours. On examination, she was very ill lying in the "gun-hammer" position, she had marked photophobia and showed great restlessness and resentment at the least disturbance around her. A purpuric rash was present. She had marked neck rigidity and all three of Brudzinski's, Kernig's and Stocker's signs were positive. (The last mentioned sign, though far from diagnostic, is of historical interest, being first described by Stocker, pharmacist to Guy's Hospital, nearly one hundred years ago. His observations were limited to the female sex, but both sexes exhibit the phenomenon! If the patient's shirt be pulled up, she will resist if suffering from meningitis but co-operate if only from a "fever." This sign is rarely absent in meningitis and is especially evident in the tuberculous variety). Lumbar puncture was performed, a turbid fluid, from which meningococci were subsequently isolated, being withdrawn. Sulphadiazine, g. 1, was promptly given followed by g. ½, at four-hourly intervals, and an injection of Omnopon, gr. 1/12, was needed to quieten her. By 10.15 p.m. her condition had deteriorated to such an extent that it seemed unlikely that she would survive until the morning. Consequently, penicillin was started at once, replacing sulphadiazine, 40,000 units (in 4 c.c.), intramuscularly three hourly, and after 40 c.c. of turbid cerebrospinal fluid had been withdrawn, 20,000 units in 20 c.c. was given intrathecally. Next morning she was much better, though still very irritable. At 5.40 p.m. a second lumbar puncture was performed, 30 c.c. of opalescent fluid being drained off until the pressure had reverted to normal and replaced by 15,000 units of penicillin in 15 c.c. On December 27, she was much better and the rash had faded so that penicillin was now reduced to 30,000 units three-hourly and was discontinued after a further two days and a total dosage of 950,000 units, including 35,000 units given intrathecally. All abnormal signs had been absent for two days. Owing to an attack of pyelitis, which responded to sulphathiazole and later of acute tonsillitis which required no treatment, convalescence was slightly protracted, but she was discharged on February 9, 1946, fit and well.

Pneumococcal Meningitis

There is an allied condition to meningococcal meningitis, namely pneumococcal meningitis. Before the days of the sulphonamides the condition was nearly always fatal, but the introduction of these drugs brought about a considerable improvement, though many cases still did not recover. Our *chef d'oeuvre* here was the complete recovery of a man, aged 59 years, with pneumococcal meningitis consequent upon bilateral otitis media, who was treated with sulphadiazine, g. 30. From many sources, one reads of the greater efficacy of penicillin, however, which is well illustrated by the following gratifying case:—

Case Three.—A girl of three was admitted to the hospital on February 6, 1946, with a diagnosis of pneumonia and meningitis. The history stated that she had been ill for ten days before with pneumonia for which she had received a course of sulphadiazine. Three days before admission to this hospital, she developed severe headache with sore throat, nausea and vomiting and, following lumbar puncture, a diagnosis of pneumococcal meningitis was confirmed for which she had received a further six grammes of sulphadiazine and penicillin, 6,000 units, intrathecally. On examination she had undoubted meningitis and signs of recovering pneumonia. In view of the large amount of sulphadiazine recently given, I decided on penicillin alone, 40,000 units, three-hourly, and also gave an intrathecal injection of 20,000 units in 20 c.c., after removing 30 c.c. of turbid fluid. On February 7, her condition had perceptibly improved. The cerebro-spinal fluid was under normal pressure but opalescent. About 6 c.c. were withdrawn and 10,000 units of penicillin given in 5 c.c. of water. On February 8, she was not so well, she had marked neck rigidity and positive Kernig's sign, so that sulphadiazine was restarted, g. ½, four-hourly. By 6.30 p.m. the child was again critically ill. Lumbar puncture was performed and a practically clear fluid obtained under normal pressure, only 3 c.c. being withdrawn. About 4,000 units of penicillin were injected in 2½ c.c. of water. Chloral and potassium bromide was given as a sedative. Signs of meningitis were still present, her lungs appeared normal but the heart was in very bad condition with cardiac failure imminent. At 11.30 p.m. there was no change and with neck rigidity and a clear fluid, I thought that sulphadiazine was more likely to do harm than good and so discontinued it, going on with intramuscular penicillin. Next morning the neck rigidity had vanished, but acute myocarditis now overshadowed all else. Apart from intra muscular penicillin, which was continued for a further two days to a total of 1,600,000 units intramuscularly masterly inactivity was the only course dictated by common sense. After being nursed flat for a week, her heart had improved and following relatively quick advances, she was discharged in excellent health on March 13.

Clinical Skill and Judgment

Recently, various articles have been published dealing with the use of penicillin in this disease. In most instances, larger doses than the above were used—for example, it is recommended that at least eight intrathecal injections are advisable owing to the tendency for relapse to occur; in the above case further interference was out of the question. Each case must be treated on its own merits and I think that it is a mistake to be too dogmatic at this stage. It was also suggested that sulphonamides should be given, especially at the start of the illness and to cover the withdrawal of penicillin; I agree, but at the same time care must be taken to avoid overdosage as this may lead to drug fever with all the classical signs of meningitis except a perfectly clear cerebrospinal fluid. (This has been noted with all members of the sulphonamides except sulphadiazine and sulphamezathine). If, with such a picture, administration of the drug is continued death will ensue. When it is remembered that penicillin administered intrathecally may also cause meningeal irritation, it will at once be appreciated that the successful management of these cases may call for the highest degree of clinical skill and judgment. The suggestion has also been made that, under certain circumstances, mainly if the cerebrospinal pathways become blocked, trephining of the skull with the intra-ventricular introduction of penicillin should be carried out, on such occasions quite justifiably, no doubt. Nevertheless, I cannot help shuddering at the thought of a too frequent indulgence in this drastic procedure by the uncritically minded, which might constitute something of a menace:—but at any rate, all will agree that penicillin constitutes a real step forward in the treatment of this serious condition, and in other forms of meningitis due to pyogenic organisms, such as the streptococcus. The tendency for cerebral or cerebellar abscess to occur in the streptococcal type renders the prognosis even more serious than in the pneumococcal variety, and again, penicillin is unquestionably the drug of choice. Of the remaining two varieties of meningitis frequently seen here, neither acute lymphocytic choriomeningitis, which always recovers, nor tuberculous meningitis, which is almost inevitably fatal, respond at all to penicillin. (Syphilitic meningitis responds to penicillin, but will be discussed under syphilis).

So far as tuberculosis is concerned, penicillin is absolutely without effect. No specific drug is known and, despite the fact that new cures are frequently hinted at, it may be many years before this urgent question is satisfactorily solved.

The Venereal Diseases

One more important and interesting subject remains for discussion. This concerns the two principal venereal diseases in this country, gonorrhoea and syphilis, and the number of cases treated with penicillin in the Plymouth Treatment Centre runs well into three figures. There can be little doubt that penicillin is the most effective remedy for gonorrhoea. Gonorrhoea has been known from antiquity, but for many years, until less than a decade ago in fact, reliance had to be placed upon local measures for its cure, such as irrigations and douches.

This was tedious, while complications were frequent. Then, like golden pennies from heaven, the sulphonamides were introduced and appeared to have solved the problem, for from clinics all over the country cure rates in excess of 90 per cent. were reported. Unfortunately, it was not long before sulphonamide resistant strains began to appear with increasing frequency. While there may have been some naturally resistant strains to begin with, it is probable that inadequate dosage was mainly responsible for this. Unfortunately, many doctors prescribed doses that were far too small, but undoubtedly the patients were often at fault, for when they were treated as out-patients one had no guarantee that the careful instructions provided were adhered to; and no doubt many patients passed on some of their tablets to boy or girl consorts as the case might be, so that as a result they would both be underdosed and then proceed to infect someone else with a now-sulphonamide-resistant strain. At any rate, in 1944, our cure rate in the centre here had declined from 95 per cent. of proved cases to as little as 55 per cent. In certain war theatres such as Italy, the position was worse and the rate of cure no more than 25 to 30 per cent., thus creating a serious problem. Then penicillin appeared and at once gave dramatic results, most clinics reporting no less than 98 per cent. of cures with dosages of about 150,000, and rates of above 90 per cent. with doses of 100,000 units. Complications are very rare now and, with the exception of gonococcal arthritis and to a lesser extent of epididymo-orchitis, respond excellently. Moreover, the treatment of sulphonamide resistant cases has been most successful, while conversely, the majority of penicillin resistant cases respond to sulphonamides or failing that to some form of fever therapy.

Penicillin in Oil

It is usual to give the drug in five divided doses of 30,000 units each, at two-hourly intervals. For this purpose, it is generally necessary for the patient to come into hospital for a few hours. More recently, however, trials have been made with penicillin in oil. As the oil retards the rate of absorption, a high concentration is maintained in the blood for a much longer period than if a single large injection of the ordinary type of penicillin is given and in the latter instance, the cure rate is only about 75 per cent. Our present practice is to give one single injection of penicillin in oil of 200,000 units or 4 c.c., so that the patient does not require admission. We have not employed the method long enough to arrive at a definite conclusion, but it would seem that the response is slightly inferior to that obtained from the method of divided doses and that a larger dose of the oil preparation may be required when the supply position improves.

Will the results of treatment become less satisfactory in time? It is impossible to be dogmatic at this stage, but it is my view that the cure rate will decline, though much less quickly than was the case with sulphonamides, because, as it must be injected, it is so much easier to ensure that the patient receives an adequate dose. As penicillin-sensitive strains are killed off, the resistant strains will tend to become increasingly common and obviously the best method of dealing with the problem is to treat vigorously and adequately with the other means at our disposal, all the penicillin-resistant cases.

Syphilis

We now come to the much more difficult question of syphilis—one of the most interesting diseases in medicine. This malady first made its appearance in Europe on a large scale in 1493, the year after Columbus made the first voyage to the New World and, curiously enough, in the year of the birth of Paracelsus, the discoverer of the first effective remedy—mercury. There is considerable, though not entirely conclusive evidence, in favour of the view that Columbus and his men had the distinction of first introducing the disease into Europe. Space precludes further consideration of the interesting history of this disease except for the mention of the discovery by Erhlich of the organic arsenicals in the first decade of the present century. The therapeutic power of bismuth was discovered soon afterwards.

The position then, until two or three years ago, was that there were available two very potent curative agents in the treatment of syphilis, supplemented in suitable cases by mercury and potassium iodide. Although a few cases proved refractory or relapsed, probably at least 85 per cent. of primary and secondary cases could be completely and permanently cured by these drugs. For permanent cure, a primary case should receive at least 18 grammes of stabilarsan or its equivalent and a secondary case at least 24. Late cases require larger doses still and it is often impossible to effect a cure, treatment being continued with bismuth, a mercurial preparation or potassium iodide, if necessary for years. This usually suffices to keep the disease under control.

It was then discovered that pencillin exerted a powerful therapeutic effect in syphilis and that the lesions of the acute stage would disappear quite as quickly, if not more so, than when the older remedies were used, together with reversion of a positive blood Wassermann to negative. Moreover, penicillin has the enormous advantage of being non-toxic, whereas arsenic may provoke dangerous or even lethal reactions, which include acute exfoliative dermatitis, acute haemorrhagic encephalitis, blood dyscrasias, jaundice and others, while bismuth often causes very troublesome stomatitis. On the other hand, the numerous injections required with penicillin are a disadvantage, though with the increasing supplies of penicillin in oil, this may soon become a thing of the past. So far, only one patient has requested a discontinuation of his treatment (after the 22nd injection) and apart from local soreness, the injections do not seem to worry the average individual.

Adequate Treatment

At first a total dosage of 1,200,000 units was generally employed in divided doses of 40,000 units intramuscularly at three-hourly intervals, but a sufficient number of early relapses occurred to impugn the adequacy of the treatment. This dose was, therefore, doubled and 2.4 mega units (60 injections) given and there are many authorities who are still adhering to this without any further treatment. The evidence that this is adequate for a permanent cure is far from convincing and most civilian centres are now giving an additional twelve injections of arsenic and bismuth though the latter is customarily omitted during the pencillin course in case it should interfere with the absorption of the last mentioned. So far, in the local clinic, no relapses have been noted after one year in primary cases, but a number of serological relapses have occurred in secondary cases, so that it is impossible to feel entirely convinced that even this amount of treatment is adequate for a lasting cure.

Waiting for Proof

As this plan is being so widely adopted, it is obviously of great importance to determine at the earliest possible moment if, in fact, it constitutes sufficient treatment. Unfortunately, we shall not know for ten or twenty years whether or not there is going to be a spate of cardiovascular or neurosyphilis in these penicillin treated cases. It took nearly as long to determine how much arsenic and bismuth were required and, in the early days, grossly inadequate doses of both these remedies were employed. My impression is that 1.2 mega units roughly corresponds to a course of ten injections of arsenic (say 4.5 g.), but it is not possible to prove this as a fact at the present time. If that is correct, however, a primary case would require about 5 mega units and a secondary case 6.5 to 7.0 mega units. Nor is it yet established whether better results would be obtained with penicillin alone or in conjunction with arsenic and bismuth. A consideration of the persistent nature and yet so many different manifestations of the disease would suggest that the more offensive weapons employed the better, especially as each probably acts in a different way.

So far as tertiary syphilis is concerned, a total dosage of 2.4 mega units will resolve gummata, interstitial keratitis and similar lesions in a few days (though from the point of view of speed only, potassium iodide is often nearly as effective!) but is usually insufficient to effect reversion of the blood serology from positive to negative. Much larger doses are necessary, but the supply position has so far limited the number of trials possible. In neurosyphilis, doses of the order of 9.6 mega units have been employed and improvements claimed, especially in acute syphilitic meningitis. In most instances, the cerebro-spinal fluid shows improvement. In tabes (locomotor ataxia), the drug is stated to have a dramatic effect on the lightning pains and even more distressing tabetic crises; but this cannot be invariable as recently I saw two patients who reported no improvement. In cardiovascular syphilis, we have not yet tried penicillin. The risk of dangerous reactions is considerable without, and perhaps even following, the preliminary exhibition of the less vigorous remedies—the so-called Herxheimer reactions.

So far as congenital syphilis is concerned, promising results

HOSPITAL FOR HIAWATHA

—America's largest Indian Hospital near Washington

NURSING, like love, knows no frontiers and the fundamentals of nursing care and treatments are much the same all over the civilized world. Differences appear, however, in many details. In this hospital for Indians, at Tacoma, near Washington, in the United States, education and occupational therapy follow the traditional lines of Red Indian culture for, unless the individual wants to create or to learn, the task will lose its value. The nurse can find out what are each patient's incentives for activity and recovery and so speed his convalescence.

Below: *the largest of America's hospitals for Indians contains 337 beds, including 190 for tuberculous patients*

TRADITION AND BACKGROUND

Above right: *a totem pole lamp: Miss Feather Vanderhoop, supervisor of occupational therapy, and Edwin Ingawnup, examine the patients' work*

Above left: *braiding Brian's hair is an important task: he will never have it cut for when he is a man he will have a plait*

Left: *the patients' work includes this modern tomahawk padded with chamois and covered with seed beads*

Right: *Agnes and Mary learn from the beginning: hospital is a place where mind, as well as body, is encouraged to grow well and strong. Miss Mae Howard gives her teaching services in hospital every week*

THE NEW SOCIAL INSURANCE SCHEME*

By A. G. POOL, B.Sc. (Econ.), Ph.D.

POVERTY, together with the social ills that it commonly breeds—undernourishment, overcrowding and squalor—may arise for two main reasons. First, a family whose normal earnings are adequate for its needs may be deprived of its income by the death of the bread-winner, or by his falling ill, suffering injury in an industrial accident, losing his job or retiring from industry. This factor can be conveniently labelled " loss of normal earnings." Secondly, poverty may arise because a family's normal earnings fall short of its requirements; it may be a particularly large family having to manage on an average wage, or its income may be low because the bread-winner is of a sub-normal type. We can label this second factor " inadequacy of normal earnings."

Of the two factors, the first is much the more important, in this country at least. The poverty surveys that were carried out in the decade before the war showed that not more than a quarter—in some towns a good deal less—of the total amount of poverty was attributable to inadequacy of normal earnings. In Sheffield, for instance, it was found in 1931—a year when unemployment was particularly severe—that nearly 95 per cent. of the poverty was due to loss of normal earnings and only 5 per cent. to inadequacy of such earnings. Even if there had been no unemployment in the city, 85 per cent. of the poverty would still have been due to loss of normal earnings and only 15 per cent. to low normal earnings.

Insurable Risks

Since the adequacy of a family's normal earnings depends primarily on *personal* factors, no scheme of insurance could be devised to protect families from the risk of low normal earnings, and other measures have to be adopted if the poverty associated with inadequate earnings is to be prevented. Among these are the family allowance scheme, which will ensure that total income increases with the size of a man's dependent family, and the free provision of certain essential services, such as the national health service and free school meals, which are shortly to be introduced. Insurance is, however, a convenient and effective means of preventing the poverty arising from the sudden loss of one's normal earnings. The risks of death, accident, sickness, unemployment and old age are very largely beyond the control of the individual family; they are capable of statistical measurement; and it is, therefore, possible to insure against them, *i.e.*, to collect premiums from those who run these risks and so to provide the funds from which compensation can be paid to those who actually suffer a loss of earnings.

Thus the primary purpose of a social insurance scheme is to protect families from the impoverishment that might otherwise arise from the sudden loss or interruption of their normal incomes. Our present schemes of social insurance are by no means completely successful in achieving this end. But, imperfect though they are, there is abundant evidence that they prevent a very large amount of destitution and suffering. Thus in the Sheffield poverty survey it was found that, even after account was taken of social insurance benefits, 15 per cent. of the working-class families were below the " poverty line "; but had those benefits not been available rather more than 60 per cent. would have been below that line.

**Abstract of a Lecture given as part of a refresher course for public health nurses arranged by the Royal College of Nursing in Sheffield.*

The failure of our present insurance schemes to provide complete social security for all members of the community is largely due to its piecemeal development. Health insurance, unemployment insurance, old age pensions and workmen's compensation were all started experimentally within a restricted field. They were then extended and adapted to meet the more pressing needs of the moment. But until the publication of the Beveridge Report no serious attempt was made by the Government to weld the separate schemes into a comprehensive whole, to fill the gaps or to remove the many anomalies.

The Self-Employed

Of the gaps in our present scheme probably the most serious is the omission of all those not working under a contract of employment. The families of men in business on their own account—retailers, window-cleaners, blacksmiths, boot-repairers and the like—are for the most part exposed to the same kind of economic insecurity as the families of wage-earners. The self-employed, it is true, are not liable to be sacked by an employer, but they are not immune from sickness, old age and death. It is estimated that there are in Great Britain about 2,800,000 in this class of self-employed persons, the majority of whom earn very modest incomes indeed. In addition there are about ten million persons of over school-leaving age and under pensionable age who are not gainfully occupied. Eight million of these are married women, most of whom are entitled to certain benefits such as widows' pensions and old-age pensions, under their husbands' insurances. The remaining two million are a very mixed bunch, including people of independent means who do not need to work, unmarried women who are housekeeping for parents, those incapable of work owing to physical or mental infirmity, and young men and women whose education has been prolonged beyond the school-leaving age. Some, though not all, in this class, need certain social insurance benefits, the most obvious being old-age pensions.

A Gap to be Filled

There is another big gap in the health insurance scheme, which restricts medical benefit to the insured worker himself and denies it to the members of his family. Yet it is obvious that a wife's illness may impose as severe a strain on a family's financial resources as a husband's illness. A relatively minor gap in the existing schemes of State insurance is the absence of any funeral grant. This has not been a serious omission because the great majority of working-class families make provision for funeral expenses through friendly societies, trade unions and, above all, industrial life offices. The case for the inclusion of death grants in a State insurance scheme is based largely on the costliness of voluntary insurance; out of every £1 of premium paid to the industrial life offices about 7s. 6d. is swallowed up by expenses and profits.

The piecemeal development of social insurance has produced not only gaps but also a complete lack of uniformity in benefits and administration. At present a single man or woman draws 18s. a week in sickness benefit, 24s. a week in unemployment benefit, and an old-age pension of 10s. a week. A widow is allowed 10s. a week. So far as needs are concerned, there is no justification for such very unequal rates of benefit. Even more striking is the unequal treatment of children and other dependants under the different schemes; the health insurance scheme provides no additional benefits for dependants, the old age pensioner is allowed an additional 10s. for his wife but nothing for any other dependant; while the man on unemployment benefit receives 16s. for his wife or other adult dependant and 5s. for a child. The administration of the health insurance scheme through Approved Societies has given rise to another series of anomalies. The Societies may, and most of them do, provide additional benefits, such as ophthalmic and dental benefits, treatment in convalescent homes and extra cash benefits; but whether an insured person receives any such additional benefits depends not on whether he chooses to pay an additional contribution for them but on whether he happens to have joined a Society whose financial position enables it to provide benefits over and above the statutory minimum. Unequal benefits for equal contributions, unavoidable so long as benefits depend on the experience of separate societies, are now regarded by most of us as incompatible with the basic principle of national insurance, viz. the collective bearing of social risks.

Main Changes under the New Scheme

The primary purpose of the National Insurance Bill, which has just worked its way through Parliament, is to set up a scheme of social insurance that will be universal, comprehensive and unified; universal in covering almost every member of the

community; comprehensive in providing for all recognized social risks; and unified in benefits and administration.

For the purpose of the new scheme the population of over school-leaving age and under pensionable age is to be divided into three classes of insured persons: (i) employed persons, *i.e.*, those who work under a contract of service; (ii) self-employed persons, *i.e.*, those who are working on their account, not under a contract of service; (iii) non-employed persons, *i.e.*, those who are not gainfully occupied. Those who are unemployed or incapacitated or who are undergoing a full-time education or unpaid apprenticeship will not be required to pay contributions but will be credited with them. It will be possible also for those with incomes not exceeding £75 a year to claim exemption from paying contributions. Married women who are not gainfully occupied will be entitled to various benefits under their husbands' insurance, and will normally be excepted from liability to contribute; but if they are already insured they will be able, if they so choose, to continue to pay contributions as non-employed persons and so qualify for certain benefits in their own right. A married woman who is gainfully occupied will be free to choose whether to be insured in her own right or to be excepted from liability to contribute; if she chooses to remain insured she will be entitled to certain benefits, such as sickness benefit, which she would not otherwise receive. Apart from these excepted classes there will be a liability to contribute (and a corresponding right to benefit) on every member of the community who is not below school-leaving age or above pensionable age; whereas under the present schemes only employed persons—and not all of those—are covered by insurance.

Contributions

The rates of contribution will depend on the class in which the insured person falls. For men and women over the age of 18 the weekly rates payable by insured persons will be as follows:—

	Employed	*Self-employed*	*Non-employed*
	s. d.	s. d.	s. d.
Men over 18 ...	4 7	6 2	4 8
Women over 18 ...	3 7	5 1	3 8

There will be lower rates than these for employed men and women earning not more than 30s. a week, and for boys and girls under the age of 18. Besides the contributions payable by insured persons, employers will, as at present, contribute in respect of their employees (3s. 10d. a week for men and 3s. for women), and the Exchequer will also be a contributory party, its supplementary payments ranging from 2s. 1d. a week for employed men to 4d. for non-employed girls. Thus there will be paid into the National Insurance Fund, through which the scheme is to be financed, 10s. 6d. a week for every employed man and 8s. 2d. a week for every employed women, with smaller amounts for the self-employed and the non-employed.

The benefits payable from the Fund will, like the contributions, depend on the class of the insured person. For employed persons all benefits will be available, *i.e.*, unemployment, sickness, maternity and widows' benefits, guardians' allowances, retirement pensions and death grants. Self-employed persons will be entitled to all of these, with the exception of unemployment benefit. The non-employed will not be entitled to unemployment or sickness benefit or to maternity allowance, but will be entitled to all other benefits, including maternity grant and attendance allowance. Thus the benefits are, broadly speaking, varied according to the needs of different classes of insured persons; those who are not liable to unemployment do not receive unemployment benefit or contribute to its cost; similarly the non-employed, with no earnings to be interrupted by illness, do not qualify for sickness benefit.

Benefits

It is impossible, in the course of a short article to describe in detail all the benefits of the new scheme and the conditions under which they will be payable. But some brief remarks can be made on the main changes. In the first place, benefits will be much more uniform in amount than they are at present. For a single man or woman unemployment benefit, sickness benefit and retirement pension will all be 26s. a week; this will be increased by 16s. where the claimant has a wife who is dependent on him, and by 7s. 6d. for the first dependent child. No insurance benefit will be payable for children other than the first, since the 5s. family allowance is now available for all such children from August 6. Those drawing unemployment or sickness benefit may also claim 16s. for an adult dependant, provided they are not already receiving an allowance for a wife. A married woman who is insured in her own right will receive an unemployment benefit of 20s. a week and a sickness benefit of 16s., unless she is supporting an invalid husband or is not living with her husband, when she will be entitled to the standard benefit of 26s. Insured married women will also qualify for a retirement pension of 26s., which they will be able to draw at the age of 60 even though their husbands have not yet qualified for a pension.

An interesting innovation is the provision whereby the amount of the retirement pension will be increased if a man or woman postpones retirement beyond the pensionable age (65 for a man and 60 for a woman). Under the present contributory pensions scheme, the pension is payable at a flat rate of 10s. whether the pensioner continues to work or not. But under the new scheme the pension will not be payable

School meals help to raise family living standards

until the insured person has retired, unless he or she is 5 years older than the pensionable age, when the retirement condition will no longer apply; and for every 25 contributions paid during the 5 years after pensionable age the amount of the insured person's pension will be increased by 1s. If the insured person has a wife, her pension of 16s. will also be increased by 1s. for every 25 contributions paid after both of them have reached pensionable age. Thus a man who chooses to remain at work until he is 70 will be able to increase his own and his wife's pension by 10s. a week each; but after he reaches the age of 70 there will be no further pension increments. As the proportion of elderly people to the total population is steadily increasing, it is becoming more and more important that those who are able and willing to continue working after reaching pensionable age should be encouraged to do so. At the present time there are only 16 old-age pensioners to every 100 contributors, but by 1975 the number will, it is estimated have increased to 31.

Waiting Time

Certain changes will be made with regard to waiting periods and the duration of benefit. Under the present health and unemployment insurance schemes no benefit is paid for the first three days of a continuous period of sickness or unemployment, however long that period may last. When the new scheme comes into operation, these three waiting days will rank for benefit provided that the claimant is sick or unemployed on a further nine days during the 13 weeks beginning with the first waiting day. Moreover if the claimant suffers a second spell of sickness or unemployment, beginning not more than 13 weeks after the end of the first, he will not have to serve a new waiting period for the second spell. Sickness benefit will be payable without any time limit provided the claimant has paid 3 years' contributions; otherwise it will cease after 52 weeks. This is a much more generous provision than that under the present health insurance scheme; sickness benefit is now payable for six months, after which a disablement benefit at the lower rate of 10s. 6d. a week is payable. Unemployment benefit will, under the new scheme, be payable for 30 weeks, with additional days of benefit for those with good employment records. The Government has, however, thought it necessary to acquire temporary powers, limited to the first 5 years of the new scheme, to continue the payment of unemployment benefits to those who have exhausted the right to benefit under the standard rules. Such extended benefits will be paid on the recommendation of specially constituted local tribunals.

For Mothers

There will be three kinds of maternity benefit under the new scheme: First, a maternity grant of £4 will be payable either on the woman's own insurance or her husband's, but not on both. Secondly, an attendance allowance of £1 a week for 4 weeks, for women who are not gainfully occupied, will be payable in addition to the maternity grant. This is intended to assist in meeting the cost of domestic help after confinement. Thirdly, a maternity allowance of 36s. a week for 13 weeks, beginning six weeks before the confinement, will be payable in addition to the maternity grant to gainfully occupied women, whether they are paying contributions or exempt. No woman will be entitled to both an attendance allowance and a maternity allowance, and payment of the maternity allowance will be conditional on the woman's discontinuing work during the 13 weeks for which the allowance is payable. These maternity benefits will be much more generous than the present one, which consists only of a grant of £2 (or £4 if both husband and wife are insured).

Widows' and orphans' pensions have also been overhauled in the

new scheme. At present a widow receives a pension of 10s. a week (plus allowances for any dependent children), which is payable throughout her widowhood whether she is young or old and whether she has children or not. Under the new scheme a widow's benefits will depend partly on her age and partly on whether she has a dependent child. In the first place, unless a widow is already drawing a retirement pension under her husband's insurance, she will receive a widow's allowance of 36s. a week (plus 7s. 6d. if she has one or more dependent children) for 13 weeks, to tide her over the period immediately following her husband's death. At the end of that time she will be entitled to a widowed mother's allowance of 33s. 6d. a week so long as she has a dependent child. When she ceases to qualify for this allowance she will be entitled to a widow's pension of 26s. a week provided she is then over 40 and 10 years have passed since she married: otherwise she will cease to qualify for any widow's benefit, unless she is incapable of supporting herself. Where a widow is left without a dependent child she will, at the end of the first 13 weeks, be entitled to a widow's pension of 26s. a week provided she is over 50 and has been married for not less than 10 years; otherwise she will cease to draw a pension, unless she is incapable of supporting herself. The orphan's allowance, payable where both parents are dead, is now to be re-christened "guardian's allowance," and will be increased from 7s. 6d. a week to 12s.

Finally the new scheme provides for the payment of death grants, the amounts ranging from £20 for an adult to £6 for a child under 3. These will be payable to the person who incurs funeral and other expenses in connection with the death of an insured person or of his or her dependant. No such benefits are payable at present.

Other Social Security Measures

The provisions of the National Insurance Bill will take effect from "appointed days" to be fixed by the Minister of National Insurance. It has been announced that the new old-age pension rates will come into force in the autumn of this year, but the scheme as a whole is not expected to be in operation until the beginning of 1948. In estimating its value as an element in a system of social security, we have to consider the insurance scheme in relation to several other measures, especially the Industrial Injuries Bill, the family allowance scheme and the proposed national health service. The present workmen's compensation legislation will be replaced by a contributory scheme of insurance against industrial accidents, providing benefits on a more generous scale than the new unemployment and sickness benefits. The family allowance scheme, as we have already seen, is complementary to the national insurance scheme, which will provide no benefits for dependent children other than the first. Medical benefit will drop out of the insurance scheme, since the proposed national health service, the most constructive and far-reaching of the social measures now before Parliament, will provide free and comprehensive medical services for all who choose to use them.

INCREASED SALARIES FOR TUBERCULOSIS NURSES—

and other Revised Recommendations by the Nurses Salaries Committee

TABLE XI.—NURSES POSSESSING THE TUBERCULOSIS ASSOCIATION CERTIFICATE ONLY

These scales apply only in Sanatoria, Tuberculosis Hospitals and other Hospitals where the major part of the accommodation is for the treatment of Tuberculosis, and in the tuberculosis wards of general or other hospitals. (For existing recommendations see Table X II of the Appendix to the Committee's First Report, Section D of Nurses S.C. Notes No. 3 and Section E of Nurses S.C. Notes No. 6).

Post	Recommended Annual Salary (exclusive of emoluments)	Total Value of Annual Emoluments	Total Value of Salary and Emoluments (Col. (2) plus Col. (3))
Nurse possessing Tuberculosis Association certificate only employed as Ward Sister	£150 rising by annual increments of £10 to £210 followed after 5 years at £210 by a further increment of £20 and after another 5 years by an additional increment of £20	£120	£270—£370
Nurse possessing Tuberculosis certificate only employed as Staff Nurse	£110 rising by annual increments of £10 to £160 followed after 5 years at £160 by a further increment of £10 and after another 5 years by an additional increment of £10	£100	£210—£280

TRAINED NURSES: TITLE TO INCREMENTS IN RESPECT OF SERVICE IN THE FORCES

The Committee have in mind that a nurse who was a trained nurse before joining the Forces and who returns to the service of his or her former employing authority has certain rights of reinstatement under the Reinstatement in Civilian Employment Act, 1944, which puts an obligation on an employer to reinstate his former employee on terms and conditions not less favourable than those which would have been applicable had the employee not performed war service. The nurse who returns to nursing under a different employer has no rights under the Reinstatement Act, but the Committee now RECOMMEND that all trained nurses returning to nursing service after service in the Forces should be granted the appropriate number of increments in respect of the years of service in the Forces.

This recommendation shall have effect from the date of publication of these Notes. No retrospective payments should be made.

POST-CERTIFICATE LEAVE FOR PUBLIC HEALTH NURSES

The Committee have decided to revise paragraph 57 of their Second Report regarding post-certificate instruction and RECOMMEND that the following paragraph shall be substituted for that paragraph, with effect from the date of publication of these Notes* :—

Post Certificate leave for Public Health Nurses.—The Committee RECOMMEND that authorities employing nurses in the public health services shall grant such staff special leave at intervals not exceeding five years to attend post-certificate refresher courses which are approved by the appropriate Government Department as suitable for the category of staff concerned. The employing authorities shall continue to pay such nurses their full salary during such absence and shall, in addition, meet all reasonable out-of-pocket expenses arising out of the courses (including the cost of board and lodging for residential school nurses receiving a resident salary and entitled to maintenance in addition, and any additional maintenance costs in which nurses receiving an inclusive non-resident salary are involved, as well as travelling expenses and fees).

For other revized recommendations of the Nurses Salaries Committee see *The Nursing Times* of June 15, 1946, page 460; June 22, pages 478-480; June 29, page 499; July 20, pages 554-556; July 27, page 577; August 3, page 593 and August 10, page 613.

Book Reviews

A WARD POCKET BOOK FOR THE NURSE.— *By Hilda M. Gration, S.R.N., S.C.M., Diploma in Nursing, University of London (Faber and Faber, Limited, 24, Russell Square, W.C.1; price 3s. 6d.).*

As the title states, this is a small book for the apron or overall pocket. It gives the requirements for certain nursing and clinical procedures, tables of weights and measures, therapeutic doses of drugs, dilution of lotions, methods of testing urine and so on, in the fewest possible words; but it supplies just the information the nurse wants at the moment she needs it. It is amply illustrated in accordance with the scope of its subject matter; but it makes no attempt to describe procedures or to explain reasons, for that would nullify the purpose of the book, which is to tell the nurse what to do but not why she does it. The latter can form the subject of her subsequent reading.

A.E.P., S.R.N., Diploma in Nursing,
University of London.

OPHTHALMIA NEONATORUM.— *By Arnold Sorsby, M.D., F.R.C.S. (Hamish Hamilton, Limited, 90, Great Russell Street, W.C.1. Price 7s. 6d.)*

All those interested in ophthalmia neonatorum and its dreaded complication of blindness or greatly impaired vision will appreciate this book. The statistics are extremely interesting. They reveal a thorough investigation into the various methods of treatment and comparisons are made from the results obtained by them.

The chapter on sulphonamide therapy shows better results from the use of these drugs than from older methods of treatment, and has resulted in a rapid decline of cases of impaired vision or blindness. The present-day use of penicillin reveals the fact that the duration of treatment is now reduced to hours as compared with days, where the sulphonamides are used, and weeks where the older methods are used.

This book has been very carefully drawn up and attention is called to the fact that although cases of blindness following ophthalmia neonatorum are now greatly eliminated due to the modern methods of treatment there is still a great deal to be done before the disease itself is eradicated.

Answers to State Examination Questions
By the Sister Tutor Section, Royal College of Nursing

NURSING AND FIRST AID

QUESTION 3.—*Outline the different methods of giving artificial respiration. How would you render first aid to a little child rescued from a pond?*

The methods of giving artificial respiration are :—

1. **Schafer's Method.**—The patient is placed face downwards, with the head turned to one side and the arms extended on either side of it. The operator kneels beside him facing his head and places his hands on the patient's back low down in the small of the back with thumbs and wrists nearly touching. To produce *expiration*, he brings his own weight forward, keeping his arms straight. Thus, the patient's abdomen is pressed against the ground, the diaphragm is forced upwards and air is driven out of the lungs. *Inspiration* is brought about when he slowly swings his body backwards thus removing the weight from the patient whilst keeping his hands in position. When the weight is relieved from the patient's body, the diaphragm descends and air enters the lungs. This double movement is repeated about 12 times a minute until the patient breathes naturally.

2. **Sylvester's Method.**—The patient is laid on his back and a folded coat or rug placed under his shoulders in order to raise the chest. If an assistant is available he should hold the patient's tongue forwards. The operator kneels at the patient's head, grasps his arms just above the elbows and presses them firmly against the sides of the patient's body. Then they are drawn upward with an outward sweeping movement until they meet above his head. The chest is thus expanded and air enters. After a pause of two seconds the arms are slowly lowered and pressed against the ribs. These movements are repeated about 12 times a minute until the patient begins to breathe naturally.

Other methods include the use of the Drinker and the Both respirators known as the "iron lungs." The machine consists of a coffin-shaped metal box which encloses all except the patient's head. The patient lies on a sorbo mattress and a rubber collar fits comfortably round his neck rendering this aperture airtight. Air enters the other end of the machine by a bellows which is electrically driven. When the bellows expand, air is sucked out of the respirator and suction is applied to the chest wall of the patient causing *inspiration*. When the bellows contract, air enters the respirator and causes *expiration* by depression of the chest wall.

The child rescued from a pond should be laid on the ground, abdomen downwards and head to one side. This position will allow any water to drain out through the air passages. If any weeds are blocking mouth or nasal cavities, these must be removed by the first aider. If the child is not breathing, artificial respiration must be commenced immediately and continued until the child breathes. Schafer's method will be the best to perform in these circumstances. If a coat or rug is available, this is placed over the child's body; clothing should not be removed, but any tight garment must be loosened so that breathing is not inhibited. When respiration is satisfactorily established, the child is carried to the nearest shelter and laid flat on a bed or couch. Wet clothing must be removed and the body well rubbed with a warm towel and wrapped in a warm blanket. He should be kept quiet and warm until he has been seen by the doctor who would have been summoned by the first aider when the accident was discovered. It is not advisable to give anything by mouth until ordered to do so by the doctor. Careful note should be taken of the pulse and respirations. If the first aider is able to gather any information with regard to the accident he should do this.

STATE EXAMINATION QUESTIONS (June, 1946)

Final Examination

GENERAL NURSING

*1. Describe the nursing care and medical treatment that may be ordered for a patient of fifty years of age suffering from congestive heart failure.

*2. A patient returns from the theatre to the ward at 4 p.m. after the operation of abdominal hysterectomy. Describe in detail the nursing care required by this patient during the next twenty-four hours

*3. Enumerate the requirements for examination of the ear, nose and throat. In what cases may the ear be syringed? Describe exactly how this is done.

4. Describe in detail the nursing care of a patient suffering from influenzal broncho-pneumonia.

5. What nursing treatments might be ordered in a case of post-operative flatulent distension of the abdomen? Describe one of these treatments in detail.

6. What are the different methods by which penicillin may be given? What special care must be taken in the administration and storage of this drug?

MEDICINE AND MEDICAL NURSING TREATMENT

*1. Describe an attack of acute bronchitis. What do you know of the causes of this condition and how may it be treated?

*2. State briefly what you know about :—(*a*) Koplik's spots; (*b*) psoriasis; (*c*) stomatitis; (*d*) nikethamide (coramine); (*e*) overdosage of insulin.

3. Describe the signs, symptoms and treatment of pernicious (Addison's) anaemia.

4. Describe a case of scabies and give a detailed account of its treatment.

SURGERY AND GYNAECOLOGY AND SURGICAL AND GYNAECOLOGICAL NURSING TREATMENT.

*1. What are the dangers and complications of a severe burn, extending from the middle of the back of the thigh to the ankle? What measures can be taken in order to prevent their occurrence?

*2. What is meant by an ectopic gestation? Describe the complications that may occur and how they may be dealt with.

3. What is the difference between a "suture" and a "ligature." How should the materials commonly used be sterilised?

4. State briefly what you know about :—(*a*) otorrhoea; (*b*) adenoids; (*c*) erysipelas; (*d*) carbuncle; (*e*) quinsy.

Final Examination For Sick Children's Nurses

SURGICAL DISEASES OF CHILDREN

*1. State briefly what you know of :—(*a*) a sinus; (*b*) intussusception; (*c*) sarcoma; (*d*) talipes equinovarus.

*2. Describe briefly the condition of a child with tuberculous peritonitis. What treatment may be given?

3. State what you know of :—(*a*) conjunctivitis; (*b*) ophthalmia neonatorum; (*c*) iritis.

4. What may cause a child to limp and complain of pain in the hip? What treatment may be necessary?

* *Questions marked with an asterisk are compulsory.*

PENICILLIN IN INFECTIOUS DISEASES

(*Continued from page 624*)

have followed the use of penicillin. The same general principles apply, but as from the start the infection is more deep seated than in the acquired form of the disease, relatively larger doses are likely to be needed as we have already found with, an as yet strictly limited number of cases.

We have seen then, that penicillin is destined to play at least one of the major roles in the treatment of syphilis. In certain cases, however, it is already indispensable. A small proportion of cases prove completely refractory both to arsenic and bismuth, but not a single case of penicillin resistance has yet been reported. Finally, penicillin has completely solved the problem of the case intolerant simultaneously both to arsenic and bismuth—a not uncommon event, and that alone is an inestimable boon.

Could the relatively small dose of penicillin used in the treatment of gonorrhoea mask effectively a coincident incubating syphilitic infection? Whilst occasionally such a dose appears to act as a provocative, in general the clinical manifestations of syphilis seem to be slightly delayed and rarely even suppressed for a long period, though the last mentioned event is apparently uncommon. In all reported cases, the blood Wassermann has invariably become unequivocally positive before the ninetieth day following exposure to infection; it should, therefore, suffice to perform a routine blood test on all cases of penicillin-treated gonorrhoea at the end of three months. In the meantime, it is deemed wiser to avoid the use of penicillin for gonorrhoea during pregnancy on account of the risk to the foetus resulting from the postponement or omission of treatment in an overlooked coincident syphilitic infection, except immediately before delivery.

Acknowledgment: *I wish to thank Dr. T. Peirson, Medical Officer of Health for Plymouth, for permission to publish this lecture.*

For the Children of Yugoslavia

Dr. Eleanor Singer discusses the problems of rehabilitation in Bosnia

Dr. Singer gives an injection to one of her little patients assisted by Sister Vivien Imber

"ALMOST every child under five years of age is suffering from rickets in Yugoslavia," said Dr. Eleanor Singer, a Londoner, and one-time assistant medical officer of health for Oxford, in an interesting talk she gave recently at UNRRA headquarters, when she was back in England for a short spell. Dr. Singer has been working in Sarajevo, capital of Bosnia, since August, 1945, and has been in charge of a Government Clinic there for women and children, very largely financed by the Canadian Save The Children Fund. A paediatric specialist, Dr. Singer wished to do clinical work in preference to administration, and so she approached a voluntary society as a means of carrying out her desire, and was sent to Egypt, hoping eventually to reach the Balkans. For several months she worked in a camp for Yugoslav refugees, in which there were about 27,000 people from the Dalmatian area; there was a convalescent hospital for about 2,000 of their children. "I found them an independent people, eager to get things going themselves, and running their own camp," said Dr. Singer.

From there, she was transferred to Italy, and, after about six months in that country, found herself, with a fully trained nursing sister and a lady dispenser at Sarasevo. This city was very crowded, as most of the countryside around had been ruined by the ravages of war and the people had flocked into the city for lodging and food. "Sixty per cent. of the women with whom we deal are Moslems, wearing veils, not the rather alluring ones worn in Egypt, but thick, heavy black affairs," said Dr. Singer. "We had travelled there with a fair amount of stores, having three trucks, one ambulance and a jeep, but we handed over the three trucks to the Ministry of Transport in Yugoslavia soon after our arrival. We had reason to be glad of our supplies, as we got very little through for a considerable time. The amount of rickets amongst the children is appalling. Undoubtedly the small children have suffered most as a result of the war. Those who had 'got on their feet' at the beginning of the war are not too bad, but those born during the war have soft bones and the malformations which follow are only too evident." The diet then was almost entirely of maize meal, with very little fresh greens, and potatoes were not available during the whole winter. Eventually some cod liver oil was got through, though it was really too little and too late; an artificial sunlight lamp also arrived which was a help.

"Of course, we could write prescriptions," said Dr. Singer, "but drugs are not only scarce but too expensive for the mothers to buy, so we feel intensely indebted to the Canadian Save The Children Fund which supports the equipment and is now sending us such things as margarine, pea-nut butter, cod-liver oil, clothing and cotton."

The Polyclinic for Mothers and Children had three branches of activity, said Dr. Singer: clinics for antenatal care; clinics for healthy children, advising on diet, etcetera, and clinics for sick children.

The Will to Help

"I cannot speak too highly of the co-operation we receive from the Ministry of Health of that country," said Dr. Singer. "They assist us in every way they can, but hospital accommodation for children is desperately short; in fact, in the whole of Bosnia there are only 53 hospital beds for children. This did not mean, however, that there was not given to the children, far from it, everything that could be done for them was done, but the means were lacking. In Bosnia one of the biggest child problems was the orphan question. There were between 80,000 and 100,000 orphans; about 4 per cent. of the entire population. They were housed in orphanages and looked after to the very limit of the ability of the people in their present conditions, the food distribution was good and everything of the best was earmarked for the orphanages, the other children and the hospitals. But general equipment was terribly short and it was quite common for two or even three children to have to share a bed in these institutions. "There is also a shortage of dietitians and we are having to work hard to get the personnel in charge of their stores in these institutions to buy local fresh fruit and vegetables which are now becoming available, in preference to serving the dried beans and peas which are supplied by the state," said the speaker.

"The Red Cross Society are doing a fine piece of work," went on Dr. Singer, "and

Below: *two of the mothers in the maternity home, where they are taught to care for their babies for the first three months if they have not a home of their own.* **Right:** *one of the pathetic victims of war, a typical example of the result of famine.* **Left:** *almost every child under five is suffering from rickets, and this deformity is tragically common to-day in Bosnia*

especially with regard to providing clothes and shoes, and I am hoping that in this coming winter we will not have any children tramping through the deep snow minus shoes and stockings as was most common last year when we were snowed up most of the winter. The children also suffer a great deal from intestinal parasites in the form of long round worms which produce chronic ill health, and are due to the bad sanitation, and the vegetables not being boiled when lifted from the infected land. Tuberculosis also is rife, and," said Dr. Singer, "it is heartbreaking that we can do so little for the children and the young adults as there are no hospitals or sanatoria for their treatment. There is a great deal of pulmonary tuberculosis and also tuberculosis of the bone, but we can do nothing much for them. Dysentery is rife in the summer, and then abates, but running ears and pneumonia often follow. On the whole the adult health is quite good apart from tuberculosis and endemic syphilis, but in the villages in Bosnia almost 100 per cent. of the population suffer from the latter disease through the use of common bowls and utensils. There is a big venereal disease clinic in Sarasevo, and there is a big check-up being taken on this disease, and also on typhus."

A maternity home had also been started in part of a convent in the city, and expectant mothers were admitted one month before the expected date of their delivery, but were transferred to the hospital for actual delivery, and returned to the maternity home on the eighth day after the birth of their baby. The mothers stayed here until the baby was 3 months old and were taught how to look after their children properly, the general care and feeding of the child, etcetera. After this, they went out and must learn a trade if they were responsible for the support of the child, and the baby stayed on in the home till it was a year old when the mother must take it to her home. Later on, if the accommodation could be increased, it was hoped to keep the child at the home till it is three years of age.

A great deal of propaganda had been launched to encourage families to adopt some of the orphan population, and had met with definite success, but so far there had been no method of checking up on the homes to which the child went because of shortage of personnel.

Skin Conditions

Asked if there were many skin conditions to deal with, Dr. Singer said she had seen less impetigo and scabies in Bosnia than she had encountered in our own country.

"These people are striving hard to put their country on its feet again, and are courageous, independent and grateful. And their Ministry of Health is doing its utmost to improve the well-being of the population. There is a splendid spirit of co-operation there," went on Dr. Singer, and told of an incident illustrating this. "On Sundays," she said, "we used to go in our jeeps up into the villages amongst the mountains, taking with us a veterinary surgeon, a tinker, a blacksmith, a saddler, and the village folk came flocking round for assistance, as they had been cut off from any help of this kind for over four years. I dealt with the medical side, and the saddler was kept busy with the harnesses, long needing repair, the tinker mended a vast number of pots and pans and the veterinary surgeon dealt with the animals. The population were intensely grateful, and at the close of the very busy day we were all invited to refreshment from the villagers. Quite spontaneously they stood up to express their thanks for our visit, and then I witnessed one of the most simple and moving scenes I have ever come across. The blacksmith rose and spoke simply but with obvious sincerity, telling the peasants that until that day he had never thought much about the milk, fruit and vegetables which came his way, or the people whose efforts produced them for him. 'But now,' he said, 'I have met you and seen many of your difficulties I am proud to have given you the labour of my hands, because only by the getting together and working together of the countryman and the townsman can real good come to our land.' Our surroundings were extremely primitive, but what wealth of wisdom lay in those words, in fact, the very foundation and hope of our civilization."

M. W. A.

In Parliament

Recently, in the House of Commons, **Brigadier Prior-Palmer** asked the Minister of Labour whether, in the interests of recruitment of nurses, the same facilities as regards railway warrants would be extended to volunteer nurses as were given to conscript nurses to enable the former to visit their homes when, unless these facilities were extended to them, they were unable to do so.

Mr. George Isaacs said that the distinction in the provision of this and other facilities available to nurses taking employment or training away from home was between those who were placed at the instance of his Department and those who were engaged direct by hospitals, and was made after consultation with the National Advisory Council on Nurses and Midwives. The facilities had not been linked with compulsory direction to hospital work which was applied in only a small minority of cases and since the removal of all labour controls was no longer exercised.

Colonel Wheatley asked the Minister of Health if, in view of the shortage of nurses, he would take steps to popularize the profession of male nurses and encourage, by generous financial assistance, those who were already undergoing training and those who were desirous of entering the profession, many of whom had some training in the services and were anxious to qualify as S.R.N.

Mr. Bevan said that the wider employment of male nurses was most desirable, and he had already urged hospital authorities to make the fullest possible use of their services. Higher salaries had recently been announced for all grades of male nurses, including male student nurses, and special allowances were paid to men who have been on war service.

Mr. Sorensen: Can the Minister say whether there has been an increase in recent years in the number of male nurses?

Mr. Bevan: Yes, sir, there has been a substantial increase.

Colonel Wigg asked the Secretary of State for War, with reference to paragraph 65 of Command Paper No. 6750, whether he could now state what arrangements as regards pay and allowances and retired pay would apply to members of the Nursing Services.

Mr. Lawson: Members of the Nursing Services of the Royal Navy, the Army and the Royal Air Force at present receive rates of pay based on those recommended for civilian nurses in the First Report of the Nurses' Salaries Committee (Cmd. 6424). It has now been decided to revise these rates in the light of increases in the rates of pay which have been recommended for application to civilian nurses as from January 1, 1946. The rates at present in force, and the revised rates, are as follows:—

Rank	*Present Rates Annual* £	*Revised Rates Annual* £
Sister	105 (a)	130 (a)
1 year ...	130	160
2 years ...	140	170
3 years ...	150	180
4 years ...	160	190
5 years ...	170	200
6 years ...	180	210
7 years ...	180	220
8 years ...	180	220
9 years ...	180	220
10 years ...	200	220
11 years ...	—	220
12 years ...	—	240
13 years ...	—	240
14 years ...	—	240
15 years ...	—	240
16 years ...	—	240
17 years ...	—	260
Senior Sister ...	220	250
1 year ...	230	260
2 years	240	270
3 years	250	280
Matron	275	300
1 year ...	300	325
2 years ...	325	350
3 years ...	350	375
4 years	375	400
5 years	400	425
6 years	—	450
Principal Matron...	500	525
Chief Principal Matron	610	635
Matron in Chief—		
Navy and R.A.F.	700	725
Army	730	755

Starting pay may be increased according to previous nursing service.

As in the case of civilian nurses, the increase in pay will be granted in two instalments, the first half as from January 1, 1946, and the second half as from April 1, 1947, except that in the rank of Matron and below the new minimum rate for the appropriate rank will be payable as from January 1, 1946, where this is more favourable.

In conformity with the arrangements already announced for His Majesty's Forces generally, war service increments in payment on June 30, 1946, will continue in payment, as a "War excess," subject to reduction by the amount of any increases in pay which become due after that date. The new rates of lodging allowance, London allowance and local overseas allowance will be payable to members of the Nursing Services as from July 1, 1946, but board and washing allowance will provisionally continue to be payable as at present. Field Allowance will cease to be payable as from July 1, 1946.

Members of the Nursing Services on Indian rates of pay will have their pay adjusted to British rates as from July 1, 1946, under similar arrangements to those already announced for unmarried officers in the Indian pay code area.

RETIRED PAY FOR REGULAR MEMBERS OF THE NURSING SERVICES

The future retired pay terms for the regular Nursing Services are under consideration. As an interim measure, pending a decision on the new terms, the existing provision will, in the case of those retiring on or after December 19, 1945, be increased by 10 per cent. Those who retired on retired pay before December 19, 1945, and who served during the war, will be allowed reassessment of their awards in respect of their war service on the general lines of the re-assessment which I announced in the House on April 15. The Pensions Increase Warrants, etcetera, will not apply to these increased and re-assessed awards.

It is the intention that the future retired pay terms for the Nursing Services, when finally approved, shall have retrospective effect from December 19, 1945, and the increased awards and re-assessments referred to above will then be adjusted to the new basis.

(*See also the "Nursing Times" of August 3*)

Correspondence

The Practical Examiner

Sister Tutor, in her letter on the conducting of practical examinations, raised some interesting points for discussion. I agree heartily that the mere possession of knowledge of the examination subject does not necessarily mean that an individual is capable of conducting an examination. The aim of every examiner should be to get the best out of the candidate. An examiner should, therefore, know something of the possible reactions of individuals to the atmosphere of an examination room, and to questioning. An examiner should be experienced in the art of questioning. It is difficult for a candidate to indulge in mental gymnastics when she is already under some considerable strain.

May I suggest the setting up of a Court of Examiners by the General Nursing Council, consisting of experts in the field of education who have studied the problem of the value or otherwise of examinations; experts in psychology; and experts in the medical and nursing fields.

The Roll of Examiners should be confined to individuals who have satisfied the Court of Examiners that they have the necessary knowledge not only of their subject, but of the educational and psychological aspects of the art of examining.

Regarding the teaching of practical work in the wards: why should a practical skill taught in the classroom be incompatible with the rush and bustle of ward life? Surely a skill is a skill and there is a good way and a bad way of performing it. Is it not easier to make up a bed which has been stripped tidily than to make up a bed that has been stripped untidily?

The classroom and the examination room should not be so alienated from the ward in the minds of those who teach practical nursing, since the whole object is to teach the nurse how best she can care for the patient and supply his needs. How many ward sisters have stated that they are far too busy to teach? Until something can be done about the adequate staffing of wards with trained staff, the ward sister will continue to relinquish this part of her work, and the sister tutor must fill in the gap. If a nurse is to realize the significance of a performance, mechanical repetition is not enough—someone must explain the reason behind it all.

D. S.,
College Member 39564.

District Nurse and Health Visitor

The "Queen's Nurse", interested in the leading article of June 22 number of *Nursing Times*, is right when she agrees that the district nurse with the Health Visitors' Certificate, should, and will, receive equal salary, but she is wrong when she says she should have more. The health visitor's work, when combined with tuberculosis and school work, can be arduous, and at times unpleasant, when difficult and dirty homes have to be dealt with. "Queen's Nurse" must remember that the administrative part of our task is just as important, and more so sometimes, as her practical work is to the patient.

The health visitor doing full-time work is not only visiting just babies; there is the work of many different clinics to run smoothly. I feel that "Queen's Nurse" has not grasped this as thoroughly as she should. Also many Queen's Nurses now embraced are nothing else but midwives. No Queen's Nurse doing health visiting, *viz.*, visiting just mothers and babies, ever does the full combined duties expected of a health visitor—full-time, and as by virtue of district nursing duties, the Health Visitor's duties become of secondary importance, the district nurse does, by comparison, only a small portion of health visitor's duties. I have done district nursing, so I know. Surely there should be some recompense for using one's brains and time for further qualifications, otherwise, why train at all.

Health Visitor,
S.R.N. S.C.M. Tuberculosis Nurse, School Nurse.

In Agreement

May I say that I agree with every word of Miss Wadey's letter in the *Nursing Times* of July 27. She has put her finger on the trouble with unerring precision, and, as a late ward sister, block sister and tutor, I have observed exactly the same when dealing with the young. I love young things. I think they are attractive and gay, but spoilt to death by their parents; as a result, they have no sense of responsibility, no "backbone," and are brought up to think of themselves first, last and all the time. Oh, for the good old days when nursing meant to nurse the sick, regardless of salary and conditions. Now the wretched ward sister has to nurse the nurse and the patient as well. Miss Wadey has rendered her profession a great service.

Mary Finch,
Sandells, Mere, Wilts.

News in Brief

A Far Call

Miss Winifred Brigginshaw, S.R.N., sailed recently to take up her post as sister at the King Edward VII Memorial Hospital, Port Stanley, Falkland Isles, 8,000 miles away.

Nurse Eisteddfod Judge

Miss E. A. Smith, matron of Swansea Hospital, is to be one of the judges of the nursing section of the ambulance competition at the National Eisteddfod at Mountain Ash, which H.R.H. Princess Elizabeth opened this year.

Midwifery Research

The College of Midwives is founding a research scholarship to enable a midwife to assist a doctor in research into the use of analgesia in childbirth. The British Oxygen Company has sent a cheque for £100 towards the £600 required.

PRESENTATION

Miss E. R. Henderson, assistant matron, Cardiff Royal Infirmary, is resigning after 25 years' service with the hospital. Anyone wishing to join in a presentation to Miss Henderson is invited to send donations as soon as possible to Miss B. M. Edwards, Cardiff Royal Infirmary.

CHANGE OF ADDRESS

All communications for the Nurses' Insurance Society on and after August 1, 1946, should be addressed to 17, Buckingham Street, Strand, London, W.C.2.

A Friend in Need

Mrs. F. P. Bolton, who made such a spirited speech on Britain's behalf in the United States House of Representatives regarding the Law which has now been passed, was responsible for a Bill bearing her name, providing for training for nurses in her country, and also for the legislation granting commissioned rank to Army nurses.

From Scotland

Male Nurses

Increased recruiting of male nurses is being carried out in the west of Scotland to try to overcome the acute shortage of female nurses.

Choir Aids Fund

The Glasgow Orpheus Choir have sent £100 to the Save the Children Fund as a tribute to the work of the Fund which they recently saw at Lubeck, in Germany.

Crisis Likely in Edinburgh

Five Edinburgh maternity homes are to close because of the lack of staff, and further closings are said to be inevitable for the same reason.

New Professor of Midwifery

Dr. R. A. Lennie, T.D., F.R.F.P.S., F.R.C.O.G., Obstetric Surgeon and Gynaecologist, has been appointed to the Regius Chair of Midwifery in the University of Glasgow.

Stirling Nurses help themselves

A garden fête, arranged by the nurses of the Royal Infirmary, Stirling, and held in their hospital grounds, raised £200 for the Nurses' Benevolent Fund.

A happy snapshot of student nurses from the City General Hospital, Herries Road, Sheffield, taken between morning and afternoon papers, of the June Final State Examination. All are members of the Student Nurses Association of the Royal College of Nursing, and all passed the examination.

Royal College of Nursing News

Membership form may be obtained from the Secretary, Royal College of Nursing, 1a, Henrietta Place, Cavendish Square, W.1., or from local Branch Secretaries

Education Department : *Provisional List of Lectures. Session 1946-1947.*

Bradford Branch.—There will be a general meeting on Monday, August 19, at 6.30 p.m. at 48, Market Street, Bradford. On *Saturday, August 31*, a motor coach tour to Morecambe, leaving Alhambra at 12 noon, has been arranged. Cost will be 9s. plus tea. Please

(*Continued on the next page*)

send names to Miss R. Walker, St. Luke's Hospital, Bradford, by August 24.

Coventry Branch.—On Saturday, September 7th, there will be visit to Oxford. Coaches will leave Coventry at 12.30 p.m. Members are requested to communicate with Mrs. Kendall, 82, Church Lane, Stoke, Coventry, at once, stating the number of seats required. Further details will be announced later.

London Branch.—Miss F. S. Major, who has recently returned from China, where she was stationed throughout the war will give a lecture on her experiences on Thursday, September 19 at 6.30 p.m. in the Cowdray Hall, Royal College of Nursing, 1a, Henrietta Place. All College members and friends are invited. Admission: College members and members of the Student Nurses' Association, free; nurses in training 6d.; others 1s.

North Kent Branch.—Members are arranging two Study Days to be held on October 3 and 4, at Dartford County Hospital. A varied and interesting programme will be published shortly.

Wigan Branch.—A tour by charabanc has been arranged for Saturday, August 31, for Ingleton. Members and friends wishing to join please write to the honorary secretary before August 24.

Ward Sisters' Study Day in London

The Ward and Departmental Sisters' Group within the London Branch of the Royal College of Nursing have arranged a study day for Thursday, September 26. The programme is as follows :—

Morning Session 10.30 a.m.—12.30 p.m.: Either a visit to The Westminster Hospital, S.W.1.. Demonstrations: *Modern Operating Theatre Technique, Radium Bomb, Deep X-Ray Therapy*; tea and coffee will be provided if visitors would like to bring their own sandwiches; or a visit to St. Mary's Hospital, Paddington, W.2. Demonstrations: *Penicillin, the Methods of Administration, Collinson's Inhaler, etcetera and Simple Demonstrations in the Penicillin Laboratory. Oxygen Therapy: Drinker's Apparatus, Oxygen Tents, etcetera.* Coffee and biscuits will be provided.

Afternoon Session 3 p.m.—6 p.m.: visit to The London Hospital, E.1. **3 p.m.** Demonstration: *Non-Touch Technique in Ward Dressings*, with discussions and questions. A talk on *Management of a Nurses Study Day* by Miss A. Harris, M.A., D.N., S.R.N. followed by a discussion. **4 p.m.** Tea. **5 p.m.** *Some Diagnostic Observations on Clinical Laboratory Tests* by Dr. May.

Fees: College members 1s. 6d.; Student nurses 1s. Other nurses 2s.

Further enquiries and applications should be made to: Miss E. M. Downer, honorary secretary, The Ward and Departmental Sisters' Group within the London Branch, 1a, Henrietta Place, Cavendish Square, W.1. (Telephone Langham 1235). Early application is advisable as accomodation is limited. Please enclose stamped addressed envelope.

A PARTY AT PORTSMOUTH

As only two student nurses of the St. Mary's Hospital, Portsmouth, unit were able to represent their unit at the Student Nurses' Association 21st Birthday Party, the unit held a party itself last month, and invited fellow members from Ryde, Chichester, Winchester and Southampton as well as members from their fellow hospitals in the City. An iced cake was purchased decorated with the Student Nurses' Association badge and a bouquet was presented to Miss Gay, matron, the President of the unit, in appreciation of her co-operation.

NURSES' APPEAL FOR NURSES

Nation's Fund for Nurses

Now that our totals are often low and we know that in these difficult times our readers cannot spare the donations that they would like to give we are more than ever grateful to those who send us tinfoil and stamps which we can exchange for money. Most nurses do not get the chance of handling milk bottle tops but if you would all ask your friends to help our scheme by collecting for us we would soon get our sacks filled and ready to send to the merchants.

Donations for the Week Ending August 10, 1946

Matron and nursing staff, Ramsgate General Hospital (monthly donation)	20 0
Anonymous	5 0
Total	25 0
Total to date	£10,700 19 0

We thank Miss Lazarus in South Africa and Miss Meadows and Miss Whiteman at home for sending us stamps, Miss M. Russell and two anonymous donors for tinfoil and College Member 23104 for a very acceptable parcel of groceries.

E. N. Price, Secretary, Nurses' Appeal Committee, Royal College of Nursing, 1a, Henrietta Place, Cavendish Square, London, W.1.

Coming Events

The Dunfermline and West Fife Hospital.—The nurses' reunion and prizegiving has been postponed and will be held on September 28, at 2.45 p.m.

Lambeth Hospital, Brook Drive, S.E.11.—The re-union and prizegiving will be held on September 7, at 3 p.m. All past members of the staff are cordially invited.

Taunton and Somerset Hospital, Taunton.—The Ladies' Linen League garden party and nurses' prize giving will be held on September 3, at 3 p.m. Past members of the nursing staff, nursing members of St. John Ambulance Brigade and British Red Cross Society who helped at the hospital during the war are cordially invited.

R.S.V.P. to Matron by August 31.

CLASSIFIED ADVERTISEMENTS CONTINUED FROM PAGE VIII

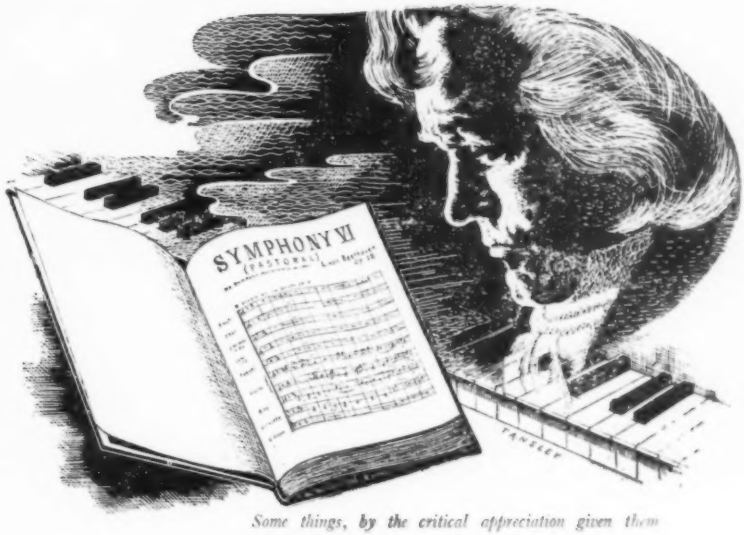
Royal College of Nursing News



Some things, by the critical appreciation given them through the years, have earned a position of . . .

Unquestioned Merit . . .

Published references in medical text books and journals during the past 30 years attest to the value of Collosol Iodine and Collosol Sulphur as therapeutic agents.

In the treatment of rheumatic conditions, particularly in the non-articular types of the disorder, Collosol Iodine and Collosol Sulphur have a long history of usefulness. A 2-3 months course as a minimum is, however, essential.

When necessary, the oral administration can be supplemented by intramuscular injections. It is usual to give Collosol Iodine and Collosol Sulphur on alternate weeks, whether given orally, parenterally, or both.

Safeguard the Invalid diet with BEMAX*

Unless suitable precautions are taken the restricted intake of food during acute and debilitating illness, together with the increased tissue wastage often present, quickly lead to a subnormal state of nutrition involving notably a deficiency of the vitamin B complex and other food factors.

Treatment of the patient convalescing from an acute illness, or of the chronically-ill, calls therefore for measures aimed at restoring the depleted reserves of vitamins. Otherwise there is a definite risk of manifestations of hypovitaminosis, such as neuritis, anorexia, gastro-intestinal atony, anæmia, and lowered resistance to the incidence of intercurrent infections.

Not only is Bemax rich in the B complex, vitamin E and iron, it also has a high nutritive value in first-class protein.

The Vitamins and Minerals in

★ BEMAX

1 oz. of Bemax provides:

Vitamin B_1	0.45 mg.	Iron	2.7 mg.
Vitamin B_2 (Riboflavin)	0.3 mg.	Copper	0.45 mg.
Nicotinic Acid	1.7 mg.	Protein	30%
Vitamin B_6	0.45 mg.	Available Carbohydrate	39%
Vitamin E	8.0 mg.	Fibre	2%
Manganese	4.0 mg.	Calorific Value	104

Vitamins Limited, 23, Upper Mall, London, W.6.

(1734)

ROYAL HAMPSHIRE COUNTY HOSPITAL, WINCHESTER

Assistant Sister Tutor required. Rushcliffe Scale. Applications with full details of training and experience, and Matrons' names for reference, to Matron. (1584)

MINISTRY OF HEALTH

Applications, from qualified Tutors, male and female (including those who have recently retired) are invited for posts under the Ministry of Health to train men and women, who have had nursing experience in the Services, for the preliminary and final examinations of the General Nursing Council for England and Wales.

The General Nursing Council for England and Wales has agreed that the course of training of these men and women will take one year and will be held at special centres in England and Wales. The tutors will be responsible for supervising the students' progress and for the theoretical part of their training, which will be carried out at the centres, the practical part being taken in neighbouring hospitals.

The posts will be temporary and will be for a year in the first instance. Salary will be according to the Rushcliffe recommendations.

Applicants should state their age, qualifications, experience, and present employment, and should say when they expect to be able to start.

Applications should reach the Director of Establishments, Ministry of Health, Whitehall, London, S.W.1, before September 16th 1946. (1633)

CITY AND COUNTY OF NEWCASTLE-UPON-TYNE

Senior Radiographer required. Resident or non-resident. F.S.S.N. in force. Apply, with particulars to Matron. (1811)

SALISBURY GENERAL INFIRMARY

Senior Physiotherapist required (non-resident). Salary according to the recommendation of the National Joint Council for Hospital Staff. Apply with particulars and qualifications to Matron. (1972)

KETTERING GENERAL HOSPITAL

Assistant Physiotheraist required. Must have all the qualifications of the C.S.M.M.G. Salary according to the Chartered Institute scale of salaries. Post may be resident or non-resident, according to the applicant's choice. Apply to the Matron. (x1965)

KENT AND CANTERBURY HOSPITAL
CANTERBURY

Pupil Housekeepers required for four months' courses commencing January and March, 1947. An honorarium of £1 0s. 0d. per month is granted in addition to board residence. For particulars apply immediately to the Matron. (1973)

THE LONDON COUNTY COUNCIL NURSING RECRUITMENT CENTRE

is open Mondays to Fridays from 9.30 a.m. to 5 p.m. (Tuesdays and Thursdays to 8 p.m.) to advise, help and offer vacancies in all grades of nursing and domestic positions in the London County Council hospitals and Nurseries.

Call or write—

The Nursing Recruitment Centre (B),
L.C.C. County Hall,
Westminster Bridge, S.E.1. (1553)

MIDDLESEX COUNTY COUNCIL
PHYSIOTHERAPISTS

Applications invited from Chartered **Physiotherapists** for whole-time appointments at:—

Chase arm Hositpal, Enfield, Mx.
Clare Hall County Hospital, South Mimms, Barnet, Herts.—Experience with chest cases an advantage.
North Middlesex County Hospital, Edmonton, N.18.—Required urgently for rehabilitation dept.
Redhill County Hospital, Edgware, Mx.
West Middlesex County Hospital, Isleworth, Mx.

Salary as recommended by Joint Negotiating Committee on Salaries and Wages (Hosp. Staffs); minimum commencing salary £270 p.a. inclusive; by annual increments of £12 10s. to £345 p.a. Previous experience as physiotherapist may be taken into consideration in determining commencing salary. M.M.G., M.E. and L.E.T. certificates required for all posts. Non-resident. Established and pensionable, subject to medical examination.

Application forms and full particulars from Matron of Hospital where appointment required.

Middlesex Guildhall, C. W. RADCLIFFE.
Westminster, Clerk of the County Council.
S.W.1. (1919)

MIDLESEX COUNTY COUNCIL

Qualified Physiotherapist required to work in Heston, Twickenham, etc. Whole-time appointment subject to medical examination. Salary in accordance with scale recommended by Joint Negotiating Committee. Travelling exenses when on duty. Use of overalls and laundry thereof. Applications (no forms provided) stating age, nationality, qualifications, and experience, with copies of three recent testimonials, to the undersigned not later than Setember 3rd, 1946.

Guildhall, C. W. RADCLIFFE,
Westminster. Clerk of the County Council.
S.W.1. (A.263) (1948)

CITY OF BIRMINGHAM
PUBLIC HEALTH DEPARTMENT

DUDLEY ROAD HOSPITAL
BIRMINGHAM, 18

Ward Sisters required in General Wards of the Hospital. Minimum qualifications State Registration, General Register, and Part 1 Central Midwives' Board. Application to Matron-in-Chief, Dudley Road Hospital, Birmingham, 18.

Physiotherapist required. Non-resident. Salary £210-£10-£240 p.a., plus war bonus. C.S.P., M.E., L.E.T. Certificates.

Pupil Midwives, Part I Midwifery. Six months' course. Salary £85 p.a.

Staff Nurses, State Registered Nurses. Good Medical, Surgical and Children's experience available, also Theatres and Special Departments.

Staff Nurses to train as Radiographers. 35 hour week. Non-resident.

Night Sisters, two required. Must be State Registered Nurses with Part I Central Midwives' Board qualification.

Student Nurses. Block system training of three years' and three months' duration. Candidates taken at 17½ years of age. Salary £55, £65 and £75 p.a. for first, second and third years respectively.

LITTLE BROMWICH HOSPITAL
BIRMINGHAM, 9.

General Trained State Registered **Nurses** required to take Fever Training. Excellent experience available and good conditions of service. Apply Matron.

Student Nurses. Fever Training School. Two years' training. Affiliated with the General Hospitals for shortened General Training. Candidates taken at 17 years of age.

SELLY OAK HOSPITAL
BIRMINGHAM, 29.

Midwife-in-Chief required in the Maternity Department (39 Beds). (The Hospital is a Part I Midwifery Training School). Minimum qualifications, S.R.N., S.C.M., G. & A. Certificate and Midwife Teachers' Certificate. Apply to Matron.

Ward Sisters, two required for Holiday duty in the General Wards. Qualifications necessary, S.R.N. and Part I Certificate of the Central Midwives' Board. Apply Matron.

Staff Midwives, two required. S.R.N., S.C.M. Salary Rushcliffe scale. Apply Matron.

Staff Nurses urgently required for Wards and Departments, resident or non-resident.

Pupil Midwives, Part I training, six months' course. Apply Matron.

Student Nurses for three years' training (excluding trial period). Salary £55, £65, and £75 p.a. for first, second and thid year respectively. Candidates taken at 17½ years of age.

SELLY OAK INFIRMARY
BIRMINGHAM, 29.

Assistant Nurses required immediately, with experience if possible. Resident or non-resident. Apply to Matron.

SANATORIUM SERVICE

Assistant Nurses required at the City Sanatorium, Yardley Green Road, Romsley Hill Sanatorium, Halesowen, Salterley Grange Sanatorium, near Cheltenham, West Heath Sanatorium, Rednal Road, Northfield.

Applications should be sent to the Matron in each case.

CITY SANATORIUM, YARDLEY GREEN ROAD, BIRMINGHAM, 9
(415 Beds)

State Registered **Staff Nurses** required. Facilities offered for training for the Tuberculosis Association Certificate. Salary, resident, £130-£10-£170. Non-resident, minimum cash salary £210. An extra £10 is paid when in possession of the Tuberculosis Association Certificate. A service allowance of £40 is paid in addition to salary at the end of two years' continuous service, and £20 on completion of each further continuous year of service. Apply to Matron.

Student Nurses required for General Training. Salary first year £60, second and third years £70, fourth year £75. A service allowance of £40 in addition to salary will be paid at the end of the first two years' continuous service. The first two years will be spent at the City Sanatorium, Birmingham (415 Beds) and the last two years at Dudley Road Hospital, Birmingham (1,000 beds). For further particulars write to Matron, City Sanatorium, Yardley Green Road, Birmingham, 9.

Student Nurses required for Tuberculosis training only. Salary first year £60, second year £70. A service allowance of £40 will be paid in addition to salary on completion of two years' continuous service. Apply to Matron.

Tuberculosis Trained Nurses required. Must be in possession of the Tuberculosis Association Certificate. Salary, resident, £85-£5-£120. Non-resident, minimum cash salary £150. A service allowance of £40 will be paid in addition to salary at the end of two years' continuous service, and £20 on completion of each further continuous year of service. Apply to Matron.

ROMSLEY HILL SANATORIUM
HALESOWEN, WORCS.

State Registered **Male Nurse** required immediately, non-resident. Salary in accordance with Rushcliffe Scale. Apply to Matron.

SALTERLEY GRANGE SANATORIUM
NEAR CHELTENHAM

Tuberculosis Trained **Nurses** required. Must be in possession of the Tuberculosis Association Certificate. Apply to Matron. (1390)

ESSEX COUNTY COUNCIL
PHYSIOTHERAPISTS

Applications invited by Essex County Council from members of Chartered Society of Physiotherapy who hold certificates recognised by that Society as follows:—

In either Conjoint (Massage and Medical Gymnastics) and Electrotherapy, or in Massage, Swedish Remedial Exercises, Medical Electricity and Light and Electrotherapy, for the following non-resident appointments:—

(1) At Oldchurch County Hospital, Romford.

(a) **Superintendent Physiotherapist** (with assistants). Salary £350 a year, rising by annual increments of £15 to £440 a year.

(b) **Physiotherapists.** Salary £270 a year, rising by annual increments of £12 10s. 0d. to £345 a year.

(2) At the Council's Orthopaedic Clinics **Physiotherapists.** Duties include attendance at After-care Clinics and Surgeon's Inspection Clinics. Preference will be given to applicants with experience of plaster work. Salary £270 a year, rising by annual increments of £12 10s. 0d. to £345 a year.

Salaries attaching to the posts and other terms and conditions of appointment are in accordance with the recommendations of the Joint Negotiating Committee (Hospital Staffs) from time to time applicable and adopted by the County Council. The appointments will be subject to the County Standing Orders and Sick Pay Rules and Regulations, extracts from or copies of which will be forwarded on application.

Apply immediately for posts at Oldchurch County Hospital, Romford, to Mr. G. T. Pegram, Administrative Offices, Laurie Square, Romford, or for posts at the Council's Orthopaedic Clinics, to the Clerk of the County Council, County Hall, Chelmsford. (1842)

SOUTHEND-ON-SEA GENERAL HOSPITAL

Vacancy for **Pupil Housekeeper,** October 1st, 1946. Four months course. Honorarium and certificate given. Apply, Matron. (1840)

THE MATERNITY HOSPITAL AT LEEDS, HYDE TERRACE, LEEDS, 1
PART I TRAINING SCHOOL
(115 Beds)

Applications are invited for the following posts:—**Staff Midwives,** S.R.N., S.C.M., or S.C.M. only. Opportunity to take "Gas and Air Analgesia" certificate. Forms of application may be obtained from the Matron. (122)

ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN
WATERLOO ROAD, S.E.1.
(RECOGNISED TRAINING SCHOOL)

Applications are invited from well educated girls for 3 years' training as **Nurses.** Minimum age 17 years. Preliminary training school in existence. Part of the training will be spent at the Seamen's Hospital, Greenwich. Salary £40, £45, £50 and £60. Uniform provided. Holiday and sick allowances given. Forms of application may be obtained from the Matron. (1

WEST KENT GENERAL HOSPITAL
(INCORPORATED)
MAIDSTONE

Two **Staff Midwives** required for the Maternity Wards. Rushcliffe Scale. F.S.S.N. in force. Apply with particulars to Matron. (1518)

MONKWEARMOUTH & SOUTHWICK HOSPITAL
(120 Beds)

Staff Nurse required for night duty, to relieve night Sister's off duty. Salary according to Rushcliffe Scale. Apply with particulars to Matron. (1512)

ROYAL FREE HOSPITAL
GRAY'S INN ROAD, LONDON, W.C.1.

Staff Midwives required—one for wards and one for District. S.R.N. and S.C.M. essential. Apply with full particulars to Matron. (1318)

THE BOLTON ROYAL INFIRMARY
LANCS.
(270 Beds)

Staff Nurses required. Excellent opportunity for or State Registered Nurses to gain experience in Surgica Nursing. Salary, emoluments, superannuation (F.S.S.) and conditions of service in accordance with Rushcliffe Scales. Applications stating age, and particulars of experience, to be addressed to Matron. (1460)

LUTON & DUNSTABLE HOSPITAL
LUTON, BEDS.
(214 Beds)

Staff Nurse required for the Private Wards Extension. S.R.N. and S.C.M. essential.

Theatre Staff Nurse required with good Theatre experience.

Salary and emoluments in accordance with the Rushcliffe Scale. F.S.S. in force.

Apply, with full particulars and Matron's name for reference, to the Matron. (x100)

JOURNAL OF THE ROYAL COLLEGE OF NURSING

Nursing Times

VOL. XLII. No. 34 SATURDAY, AUGUST 24, 1946

EDITOR: MISS K. F. ARMSTRONG, S.R.N., S.C.M., DIPLOMA IN NURSING, LONDON UNIVERSITY

Transatlantic Teaching

ALTHOUGH the first nursing school was the Florence Nightingale Training School, at St. Thomas's Hospital, London, set up in 1861, and this example stimulated the development of nurse training schools throughout this country and in many other parts of the world, nursing education has developed differently in different countries: Miss Agnes Gelinas, R.N., A.M., writing the monograph, "Nursing and Nursing Education,"* for the New York Academy of Medicine Committee on Medicine and the Changing Order, brings out well the contrasts between development in the United States and in this country. Miss Nightingale advocated that schools of nursing should have their own governing bodies, their separate finances, and be self-supporting organizations. In this country, the Nightingale Training School was of this nature, being financed by the money subscribed by the public in gratitude for the work which Florence Nightingale did for the British soldier in the Crimea, but the majority of training schools are under the management of the hospital boards and they have, to a large extent, been developed as a means of staffing the hospital rather than as educational establishments to prepare entrants for a professional career.

In the United States there was the same tendency in the early years, and hospitals, unable to secure the services of a permanent staff of trained nurses to assume the responsibility for the nursing care of the patient, depended almost entirely on the work of nurses in training for this service. As a result the education of the student nurse suffered, for the nurse superintendents were under such pressure to provide more nursing service at a low cost, that they had great difficulty in adopting adequate standards and much so-called training consisted of student nurses learning the work from each other in the wards, with one lecture from a doctor each week.

The United States made a step forward in 1899 when a university course for graduate nurses who wished to continue their studies in nursing, was set up at Teacher's College, Columbia University. This course was for heads of hospitals and schools of nursing. (No such courses came into being in this country till after the 1914-1918 war). Ten years later the first collegiate programme for students who had had no previous nursing education, and wanted to combine nursing with liberal arts courses, was established at the University of Minnesota. This example has been followed in other centres and, to-day, Miss Gelinas tells us, "out of about 1,300 under-graduate schools of nursing in the United States, approximately 10 per cent. are collegiate schools and the remaining 90 per cent. belong to hospitals." The collegiate schools "have various kinds of connections with colleges and universities, ranging from the weakest type of affiliation to complete ownership and control by strong universities."

As no schools of this type exist in Britain, nurses here will find what Miss Gelinas has to say about them particularly interesting, though we must keep in mind that she says that "the typical American school of nursing is maintained by the

hospital" as in this country and "is essentially a service organization," suffering, as do our schools here, from the faults of too many hours of non-educational nursing service in the wards, too few hours of instruction, and limitation of the clinical experience of the individual student nurse to that provided and needed by the hospital.

If college work is combined with the nursing programme, the period of training may be four or five years. The pre-clinical curriculum, which corresponds to the pre-nursing or preliminary training school course there, is superimposed on two or more years of liberal arts courses in college and after this period there follows a clinical programme usually extending over two and a half years. This co-ordination of nursing and general education has a great deal to recommend it and should particularly receive consideration here; for experience has proved again and again that with entry of girls to training schools at 18 years of age, as occurs to-day, a very great wastage results because so many of these young candidates cannot cope with the heavy responsibilities and the physical strain of nursing training in its usual form.

The young candidate for nursing in the collegiate school is provided not only with the basic preparation in theory and practice of nursing of the pre-nursing and preliminary training school course: the course has also good cultural content and students have the advantage of contacts with students and instructors in fields other than nursing in the university. The desirability of this is very obvious if nursing is to continue to attract to its ranks the girl who wants to nurse but has the ability necessary for a university training. Not all girls who wish to nurse have this ability and other types of training would always be necessary. On the other hand, some schools of the collegiate type offering a degree course in nursing of the graduate type would help to ensure that nursing attracted sufficient numbers of able women with wider education and would bring these young women into the hospital ward at the age of twenty, when they would be much more suited to meet the physical and emotional strain and responsibility involved in the care of the sick.

Of course, the nursing profession also looks to the Universities to help with post-graduate education, but this is a different matter and courses for nurse teachers and leaders in public health and institutional nursing will always be needed. Miss Gelinas asks, too, for post-graduate courses within the hospitals for trained nurses—she calls them "in-service programmes of education for employees"—as a means of improving nursing service. She points out that thousands of nurses have graduated from schools of nursing with less than the desired instruction and practice. She suggests centres which will provide intensive courses of clinical nursing, nursing instruction and practice and supplementary experience in psychiatric and communicable diseases, for all who have not had this during their training. Young nurses would do well to follow her advice and obtain at least two years' further experience in hospital after qualification, aiming at getting experience in any field in which they have not already worked if their training has not been complete.

These are some of the most striking features on the question of nursing education from Miss Gelinas's book. There is food for thought in them for we cannot say that we have yet provided the enlightened nursing services here that the country needs to ensure the finest of health services for all.

Topical Notes

Know the Facts

As we suggested might happen in our leading article "A Negotiating Body" on December 29, 1945, when the Trade Disputes and Trade Union Act, 1927, was about to be repealed, a number of Local Authority Councils in different parts of this country are passing resolutions requiring that their employees shall be members of a Trades Union catering for such employees: these resolutions are now legal, although they were illegal until the repeal of the Trades Disputes and Trade Union Act in May, 1946. The first such resolution to receive publicity was passed by Salford Town Council in July and it was wrongly reported in the press at the time that this made it necessary for all employees to join a trade union, that medical men in the employment of the Council must belong to a doctors' trade union and that membership of the British Medical Association was not sufficient. *Actually the words of the resolution passed in this case do not, in fact, make it necessary for doctors, nurses or any other workers to belong to a trade union.* They were only required to belong to an organization which could negotiate salary scales and wage rates for

its members. Membership of the British Medical Association covers the doctor and membership of the Royal College of Nursing and the Student Nurses' Association covers the nurse and the student nurse respectively: indeed of the 20 representatives of nurses on the Rushcliffe Nurses' Salaries Committee 9 were representatives of the Royal College of Nursing, and of the Scottish Wheatley Committee 10 were representatives of the College of Scotland: in Northern Ireland the picture is the same. All members should make use of their membership in this connection and should make these facts known to non-members among their working colleagues.

D.D.T. Poisoning

THE *Lancet* of August 17, gives a report of the second fatal case of D.D.T. poisoning in human beings: a market gardener's labourer drank about six ounces of concentrated D.D.T. emulsion, intended to be diluted 400 times before use as a spray for mushrooms, on March 19, 1946. Death occurred within an hour; the lungs were congested and the air spaces full of haemorrhagic frothy fluid: the linings of the stomach and the upper part of the small intestine was congested: no other abnormalities were seen. Post mortem examination of the negro child who took D.D.T. accidentally and was the first reported case of death from D.D.T. poisoning, and of the baboon who died after drinking a solution of this drug, showed similar pulmonary oedema. The report suggests that the congestion of the mucosa of stomach and intestine in this case was due to the action of the solvent used; also that paralysis of the legs and unconsciousness followed the taking of the dose after a short interval, as the man fell, hurting his face, and only vomited a small quantity of vomit. These cases show the need for care in keeping D.D.T. solutions out of the reach of children: the lethal dose is estimated at between 150—600 mg. per kilogram of body weight.

In The Mental Hospital

THE new salary scales recommended by the Mental Nurses Sub-Committee of the Nurses Salaries Committee (see p. 646-7) bring the salaries of nurses in the higher posts in mental hospitals into line with those in other hospitals whose salaries we published on July 20, page 554. The range for matrons in mental hospital training schools is slightly lower than that in general hospital training schools, for example the mental hospital matron receives £430 to £650 (over 1,330 beds) and £330 to £480 (330 to 499 beds) while the general hospital matron receives £500 to £750 (over 1,000 beds) and £430 to £610 (400 to 499 beds). These figures exclude emoluments. This discrepancy is is probably due to the fact that the mental hospital matron's responsibility is considered less for she always has a resident medical superintendent. She should, however, have the same responsibility for her staff and the nursing care of the patients; also the same status. On the other hand, the mental hospital tutor receives the salary of the general hospital tutor plus £20 for her mental training. This we hope will help to remedy the rarity of qualified mental hospital tutors, though the position is so bad that more might have been done. In an era of scarcity of mental nurses this is one particularly to be deplored for on the tutor depends so much of the nurses' knowledge, and nurses in the mental hospitals, with the new treatments and new outlook, are taking on new responsibilities while the number of mental trained tutors can almost be counted on one hand. The policy of the Nurses' Salaries Committee to award a higher salary to the deputy matron than to the tutor continues. Here, owing to the lack of tutors it might have changed. One can only hope that new recruits will not too soon be diverted from tutoring to administrative work.

THIS WEEK

DATES TO REMEMBER

September 9 to 13: Public Health Nurses' Refresher Course in Glasgow open to others to book after August 29, (see p. 653).

September 26: Ward Sisters' Study Day In London, open to all nurses and student nurses. Private nurses may obtain grants towards their expenses on application to the secretary of the Private Nurses Section at Headquarters. (See last week's *Nursing Times*, p. 634).

In Praise of UNRRA

"We should like to convey our deep appreciation to the professional nursing groups of all of the contributing countries for their unselfish assistance in providing UNRRA with so many of their most able colleagues. In every country we visited it was evident that the high calibre of personnel was the decisive factor in spelling success or failure in our attempts to help the liberated countries in the re-establishment of their nursing services. UNRRA nurses were usually on the spot before supplies and transportation, and other facilities considered essential to any program, and it was up to the nurse to make herself useful from the start by "making do" with little or nothing. That she was still able to give encouragement and new spirit to the nurses who had suffered so much during the war years only emphasizes her essential worth."

Miss Lillian J. Johnston, R.N., chief nurse of the United Nations Relief and Rehabilitation Administration, writing on "UNRRA Nurses in Europe, 1946" in the New York Journal "Public Health Nursing."

Summer School at Somerville

THE Central Council for Health Education at present and until the 28th is running a summer school at this famous women's college at Oxford, and those fortunate enough to have secured a vacancy have a fine programme before them. The list of lecturers is stimulating, and it is interesting to learn that 25 per cent. of the places in the summer school have gone to trained nurses; it is good to know that they are anxious to extend their knowledge through the lectures and in contacts with their colleagues in the teaching and medical professions.

An Important Announcement

As we go to press, the Royal Medico-Psychological Association have made a most important announcement to the mental nursing profession: the cessation of their examinations. In agreement with the General Nursing Council for England and Wales candidates will not be accepted for training after December 31, 1946. Those holding Royal Medico-Pyschological Association final certificates will be entered on the appropriate parts of the State Register, for mental or mental defective nurses, on application to the General Nursing Council, 23, Portland Place, W.1, on or before December 31, 1951. The General Nursing Council will, at present, approve those schools approved by the Association. We will give full information next week.

The Next Step

THE House of Lords will, we learn, consider the National Health Service Bill on October 8 and 9, unless present plans are altered.

HIGH MILK TENSION AND BREAST FEEDING*

By HAROLD K. WALLER, M.B., B.Ch.
Honorary Paediatrician, British Hospital for Mothers and Babies, Woolwich, S.E.18

THE subject of high milk tension is chosen because of its bearing on the course of breast feeding. Continuance of secretion depends on milk being repeatedly removed, by which means tension is kept low. Incomplete removal which does not lower it enough is followed by a decline in production, while, if tension becomes very high, as it does when the breasts get engorged during the first week, secretion may cease very quickly. The best example of this is seen after a stillbirth. The breasts fill just as when the child survives; next they become overloaded and tense. After a few days tension falls, production ceases, milk is absorbed and involution follows. By the end of three weeks or so the breasts have reverted to the resting stage and have returned to the size they were before conception.

This engorgement often arises after the birth of a living child and when of an extreme degree, the breasts become oedematous and pit on pressure. The skin covering the gland, the areola and the surface of nipples share in the oedema and, I believe, the ducts also; for milk does not escape nor can it be forced out by manual expression. If the baby is put to feed it obtains nothing or next to nothing. Tension, therefore, remains high, and when later it declines the fall occurs for the same reason that causes it after a stillbirth; outflow is obstructed, production is interfered with and involution begins. Unless this is appreciated and steps are taken to counteract it, the fact that regression is taking place is not realized. Later, in the third or fourth week, we hear the familiar story, " I had too much milk when I was in bed but it left me soon after I got up." The fact is that it was declining while she was still in bed. Even when breast feeding is well established if drainage for any reason is interrupted so that tension rises, production will decline. It frequently happens if baby and mother are separated, as for example when the baby is admitted to hospital. The failure is usually attributed to worry.

Causes of High Milk Tension

We need, therefore, to consider the factors responsible for overloading of the breasts. We can define several, as follows :—

(1) **The Action of Hormones.**—It is thought that oestrin, one of the ovarian hormones concerned in the formation of the secretory tissue, antagonizes prolactin, the secretory hormone controlled by the anterior part of the pituitary gland. In the last weeks of pregnancy the oestrin content of the blood is high; after delivery it falls, prolactin is free to exert its action and active milk secretion begins, usually on the third day. In practice we cannot measure these changes, but we watch their effects. There are marked differences in the start of lactation; sometimes it is sudden and excessive, sometimes slow and gradual. It is possible this variation reflects differences in the rate of fall in the oestrin content of the blood, or in the amount of prolactin produced. This is theoretical but, as we shall see later, it has a practical application.

(2) **The Amount of Secretory Tissue Present.**—There is microscopic evidence of wide variations in this, but we cannot apply this knowledge clinically. An increase of 3 or 4 inches in the chest measurement during pregnancy is a rough indication that enough milk forming tissue is present. The breast that feels hard and the one overloaded with fat, are apt to give a small yield.

(3) **The Character of Skin Covering the Breast.**—We have come to attach much importance to this. When the skin is thin and elastic it allows a larger volume of milk to be accommodated without a great rise of tension. Conversely if it is thick and unyielding a moderate increase in the volume of contained milk will cause a disproportionate rise of pressure. This does not seem to have attracted much attention in the human, but has long been recognized as of importance in animals. In dairy farming an udder with an elastic covering has a marked bearing on the yield of milk and is one of the aims in selective breeding. In women the covering skin becomes stretched as lactation proceeds and is one reason why high milk tension occurs more often at the beginning of the first lactation than in subsequent ones.

(4) **The Number and Patency of the Ducts.**—The number of ducts opening on the surface of the nipple also varies; in the same woman they may be numerous in one nipple and single in the other. There is reason to think some ducts are not patent at term but only become so later. A large number, 12 to 20, should allow rapid drainage which is an advantage. As with the covering skin, the duct system becomes stretched so that in time its total capacity enlarges.

(5) **Anatomical Defects of the Nipples and Lacteal Sinuses.**—The nipple should project and be loosely attached to the underlying structure of the breast; instead both or one may be firmly anchored or so badly developed as to be inverted. These are practically always developmental errors and are quite incapable of being produced by tight clothing. When short and anchored the baby cannot draw them far into its mouth, and the action of its jaws, which should fall beyond the nipple's base, causes it to retract. With this defect the lacteal sinuses are often situated far back and seem to be ill developed. Malformation of nipple or sinuses make the child's task difficult, and its contribution to emptying the breasts is less than it should be.

(6) **The Size and Vigour of the Baby.**—Here again wide differences exist. The weakly or premature baby may be quite unequal to taking enough milk to affect tension.

(7) **Pain.**—Nipples which cannot easily be drawn far into the child's mouth are specially liable to injury. The oedematous nipple is bound to be damaged if suckling is attempted. Pain interferes with the delicate reflex by which milk is forced through the duct system when the child feeds. This expelling mechanism, known as the " draught," depends on the hormone of the posterior part of the pituitary gland; the same hormone which stimulates uterine contractions. You will remember a very old method of trying to control post-partum haemorrhage is to put the newborn to the breasts. The same pituitary effect is responsible for suckling producing " after pains."

These make a considerable list. What then can we do to prevent high tension arising, and to curtail it when it does arise ?

Means of Control

Taking the causes in order, we can counteract the fall of oestrin by giving one of the artificial preparations of this hormone; this will lessen the action of prolactin. Here we use stilboestrol, giving it by mouth when tension threatens to be excessive, or when it has become so. The dosage needs experience, and if judged correctly the results are excellent. Secretion is lessened and tension falls, but there is a delay of perhaps three days before the full yield is revived. It always does revive, and does so more slowly so that the breasts do not fill rapidly. From 15 to 30 mg. is usually enough and it is given in 5 mg. doses 4 hourly, without interruption until the woman gets relief from aching in the breasts. You can see in the ward a woman who got a very sudden intense degree of engorgement with much oedema so that outflow was completely obstructed. She was given 120 mg., a high total. Until tension fell, feeding was withheld to prevent injury of the nipples. On the 8th day the yield had returned and the baby took 17 ounces of milk, feeding is going smoothly and I believe she has been saved the risk of losing her milk. It is my hope that midwives will learn the use of this drug and be allowed to apply it in practice.

We cannot influence the amount of secretory tissue formed during pregnancy, though some day this may be possible. We cannot alter the character of the skin covering the breasts.

The patency of the ducts can be improved, and perhaps accelerated, by teaching the expression of colostrum during the last weeks of pregnancy. The method, to be effective, must be carefully taught. (It was demonstrated by a primigravida at the 36th week of pregnancy.) Recently we compared 100 primiparae who had employed this with 100 who had not, the management of both groups being otherwise identical. At 6 months, 83 of the first group were still successfully breast feeding compared with 42 of the second. High milk tension was 3 times as frequent

* *Abstract of a lecture given during an open day at the British Hospital for Mothers and Babies, Woolwich.*

and damage to nipples twice as frequent in the controls in the first fortnight. Since then we have tried to teach the method to all before the first lactation, and those who have had difficulty or have failed to breast feed.

To improve the freedom of the nipples' protraction we get all women with defects to wear glass shields which were designed originally to protect the clothing of nursing mothers. They serve our purpose very well. The hole in the shield is fitted accurately over the nipple and is held in position by a firmly supporting brassiere. The shields may need to be worn throughout pregnancy if the nipples are inverted or retract badly, for which reason the examination for defects should be made and the result recorded at the first ante-natal examination. We have experienced no harm whatever from their use and they have enabled many women to succeed who have failed in previous lactations.

Finally, we must not rely on the baby necessarily being able to drain the breasts sufficiently to reduce and keep tension at a safe level during the first fortnight; perhaps during the first month. Even a vigorous baby, taking four or five ounces of milk at each feed from easily flowing breasts, may leave as much again within the glands. This excess should be removed by hand, and it is an advantage to remove the majority before feeding. The removal can be taught in a few lessons and tuition is best given in pregnancy. We recently had a young primipara who was yielding 55 to 60 ounces daily by the end of the first week, of which her baby needed about 20 ounces and could not take more. The improvement in the protraction of the nipples gained by the use of the shield in pregnancy greatly lessens the likelihood of damage, but even so, vigilance must not relax. We teach the nurses to enquire of every mother for pain at every feed. An admission of pain is reported, and the nipple's surface is examined at once through a lens by the Sister. If any damage can be seen feeding is withheld, and the milk is expressed by hand until the injury is securely healed. In this way pain is saved, and even more important, the risk of mastitis and breast abscess is reduced to a minimum.

Summary

The principle involved is quite simple, tension must be kept low by adequate drainage. This is favoured when the nipples are well developed, the ducts numerous and patent and the baby is vigorous. The detection and improvement of defects of the nipples must be part of the routine ante-natal supervision, and I would emphasize that minor defects interfering with the range of the nipple's protraction are very common. The extra work involved is more than counterbalanced by the ease with which lactation starts and the security of breast-feeding when the woman leaves hospital. When despite precautions, engorgement arises, we have, in Stilboestrol, a most useful means of controlling and reducing it. The same measures provide us with the necessary safeguards against mastitis and breast abscesses. Late results show that if the start can be made safe and painless, and if the yield is steady and provides the baby's needs at the end of the lying-in period, most women will continue to breast-feed and will not resort to artificial milk. We scarcely meet with unwillingness.

For the Student Nurse

Answers to State Examination Questions

By the Sister Tutor Section, Royal College of Nursing

FINAL EXAMINATION FOR SICK CHILDREN'S NURSES

Surgical Diseases of Children

QUESTION 4.—*What may cause a child to limp and complain of pain in the hip? What treatment may be necessary?*

Any of the following conditions may cause a child to limp and complain of pain in the hip:—tuberculous infection of hip; osteomyelitis; infective arthritis; Perthe's disease; rheumatism.

The child with a tuberculous hip will, in addition to pain and consequent limping, have "night cries" due to the pain caused by rubbing of inflamed surfaces of bone when muscles are relaxed in sleep. Perthe's disease produces signs and symptoms very similar to those of tuberculous hip disease and is sometimes mistaken for this condition. Treatment in both these conditions aims at improving the general condition of the patient, and putting the joint at rest by avoiding movement and weight-bearing.

There are three methods of immobilizing the joint: (*a*) Jones' abduction frame; (*b*) extension by weight and pulley; (*c*) plaster of paris spica. Whichever method is chosen, the child should be nursed out of doors as the treatment will be of 18 months' to 2 years' duration. Special nursing care is required to prevent the development of pressure sores. If immobilization is carried out by Thomas's splint with weight extension it is important that continuous traction is maintained. Although out of doors, the child must be protected from excessive heat in the summer and never at any time face the full glare of the sun. A sun hat should be worn.

The diet must be carefully constructed to include foods rich in vitamins. Butter and milk will supply A and D, with cod-liver oil to give an additional amount. Fresh fruit and green vegetables carefully cooked will supply vitamin C and increase the general resistance of the patient.

X-ray photographs are taken every three months to check the progress, and when there are no further signs of disease, and if the position of the hip is satisfactory, exercises and massage are given to restore the muscle tone. A hip spica will be applied and the child allowed to get up on crutches. If there should be any recurrence of pain the child is put back to bed and the joint immobilized as before.

If tuberculous infection results in fixed deformity of the hip, operative treatment may be used. Osteotomy is performed and the child nursed on an abduction frame for the first three weeks. When the stitches have been removed, passive movement is ordered and the child is got up as early as possible with a caliper.

Osteomyelitis, if diagnosed early, responds most successfully to penicillin. This is given by intramuscular injection at three-hourly intervals. The child is kept at rest in bed with or without a plaster of paris splint to immobilize the limb. The child's general condition must be improved and a light, nourishing diet given with plenty of fluid. The child may be nursed out of doors if the weather is suitable. If diagnosis is delayed, the diseased bone will need incision and the cavity cleared of sequestra. The wound is then packed with vaseline gauze and the limb encased in a plaster of paris splint. This splint will require renewing at intervals until the cavity is healed.

To treat infective arthritis the child must have complete rest in bed with general nursing care. The joint is aspirated in order to discover the causal organism and the appropriate sulphonamide drug given. Local treatment by applications of heat will relieve the pain and the joint should be given support.

Rheumatism may cause a child to limp and complain of pain in the hip. Treatment consists of rest in bed with local applications of warmth to relieve the pain. The specific drug, sodium salicylate, is given in appropriate dosage. Diet should be light and nourishing. Good convalescence is necessary to prevent recurrence of the condition. The patient should be thoroughly examined for any sign of sepsis, and infected teeth or tonsils must be removed.

Plays and Films in Brief

Fear No More (*Lyric Theatre, Hammersmith*)

A medley of theatrical farce, philosophy, drama, psychology, pathos, thriller and almost *grand guignol* forms an unsatisfying play. Nurses will hardly appreciate the crude misrepresentation of themselves and their colleagues in the scenes in the theatre and private ward. Yet the play proclaims the torture of mental suffering compared with physical pain and might have been great had the authors shown more clearly what they wanted to do. Raymond Huntley gives a good performance as a patient. Wenda Rogerson is the one sympathetic nurse and the settings on board ship are excellent.

Anna and the King of Siam

A story of an English widow who travelled to the "barbaric" land of Siam to teach the King's wives and 69 children English—with an American accent! Rex Harrison and Irene Dunn made the best of their parts.

A Genius in the Family

This story is great fun. Myrna Loy and Don Ameche are the principals, and the small boy—Bobby Driscoll—is a joy. The period is 1870 and Myrna's dresses are a delight. She wears them beautifully.

FRACTURE OF SHAFT OF THE FEMUR TREATED WITH KÜNTSCHER INTRAMEDULLARY NAIL

By M. O'TOOLE, Senior Sister Tutor, Central Middlesex County Hospital, N.W.10

SO impressed have I been with this new method of treating fracture of the shaft of the femur that I wish to give a short description of it. It is interesting to note that these nails or pins were found in some of our troops who had fractures of the femur and who were prisoners of war in Germany during the recent war.

The Kuntscher nail is tubular, made of stainless steel and may be had in different sizes. For the following case, one measuring approximately fourteen inches long and half an inch in diameter was used.

Admission to Hospital

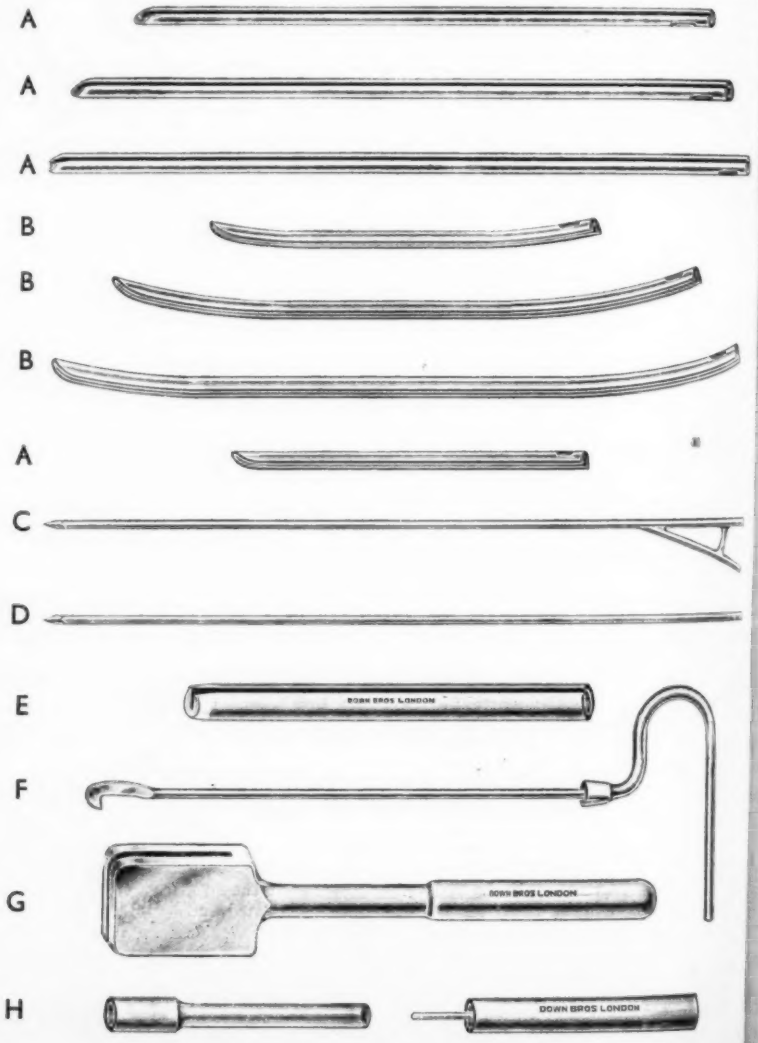
The patient, a man of twenty-one years, was admitted on April 9, 1946, with a history of having fallen ten feet from a scaffold, on that day, and having injured his left leg. On admission he was lying on his right side with the left leg held slightly flexed, there was some swelling and deformity of the thigh, but no abrasion; his condition otherwise was good and there was no loss of consciousness. Temperature and pulse were normal. Fracture of the shaft of the left femur was diagnosed. On X-ray examination, a transverse fracture of the mid-shaft of the femur was seen.

Skin traction was applied (strapping extension) with ten pounds weight, with the leg resting on a Thomas's splint, pending a decision as to further treatment. It was decided to operate on April 15, 1946 and to insert the Kuntscher pin.

Penicillin, 15,000 units three hourly, intramuscularly, was commenced on April 14; the usual general and local pre-operative treatment was carried out, premedication consisting of Omnopon, grain ¼, hyoscine, grain 1/150, one hour before operation.

Operation

The operation, on April 15, was performed under a general anaesthetic (pentothal and ether). An incision was made over the left great trochanter and the trochanter exposed. In this a burr hole was made through which a guide wire was introduced into the medulla of the femur. A second incision was made in the thigh over the site of the fracture, the bone fragments were manipulated into position and the guide wire, which was continued from the upper end of the bone, was introduced into the marrow cavity of the distal end of the bone. The Kuntscher nail was then introduced along the guide wire and hammered into position (see diagram), the upper end was left protruding slightly, *i.e.*, outside the great trochanter. The guide wire was removed and both



Right: *instruments used in the operation for insertion of the Kuntscher intramedullary nail. Straight Kuntscher nails are opposite the letter A; curved Kuntscher wires are opposite the letter B; guide wires are opposite the letters C and D; an impactor is opposite the letter E; and extractor is opposite the letter F; a mallet is opposite the letter G and two types of punch are opposite the letter H. The extractor is used to remove the pin at the end of a year*

Below: *a diagram of the left femur showing the site of the fracture with the Kuntscher nail in position*

wounds closed, the protruding end of the pin being covered with muscle and skin.

Post-Operative Treatment

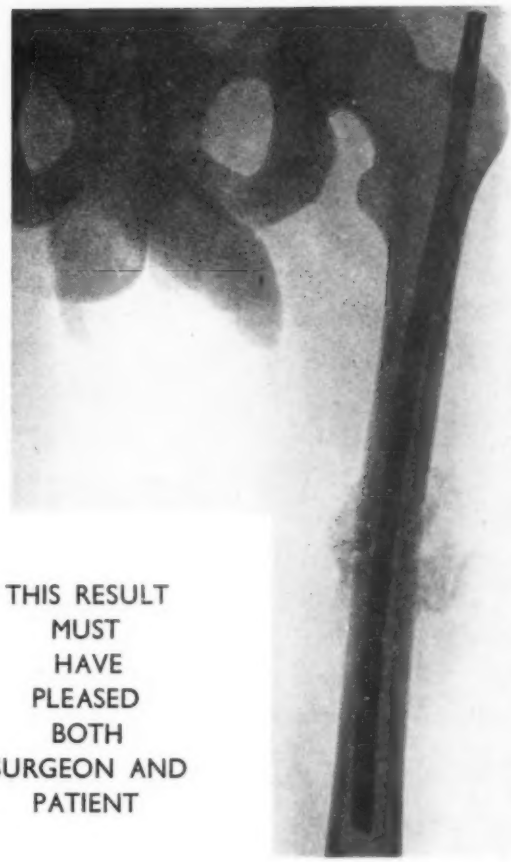
Penicillin, 15,000 units three hourly, was continued for ten days after the operation. Movements of the hip and knee were ordered to be commenced on the third day. The usual general nursing was carried out. The day following the operation the general condition was satisfactory but the temperature rose to 101.6°F. pulse 88, and there was an effusion into the left knee joint; for this a pressure bandage was applied. Two days later the effusion was decreasing, the temperature gradually came down and the movements were commenced as ordered.

The nursing of this patient was easy for there were no splints, plaster or extension of any kind used he was nursed on an ordinary bed and moved quite freely for bed-making. Stitches were removed on the twelfth day and both wounds were satisfactory.

It was hoped to get him out of bed a few weeks after the operation, but the effusion limited the movement of the knee joint and not until full movement was obtained was weight bearing allowed. On May 24, 1946, the patient was allowed up and to put weight on the leg, *i.e.*, five and a half weeks after the operation. Gradually he commenced walking again with the aid of a stick and, when discharged from hospital on June 16, 1946, he was walking quite well. He has been instructed to report to the out-patient department at intervals and the possibility is that the Kuntscher pin will be removed at the end of a year. X-ray examination before leaving hospital, showed good callus formation.

I should like to thank Mr. A. E. Stevens, F.R.C.S., who was in charge of the case, for permission to publish the article; also Sister Edwards who answered all my enquiries and who was so helpful when I took student nurses to see the patient.

Messrs. Down Bros. very kindly supplied the electro illustrating set of instruments.



THIS RESULT MUST HAVE PLEASED BOTH SURGEON AND PATIENT

Right: X-ray taken of the fractured shaft of femur with a Kuntscher intramedullary nail in position. It shows the excellent position of the bone and good callus formation. The patient was allowed to put his weight on the leg five and a half weeks after operation.

MEDICAL NOTES

Folic Acid for Blood Disorders

For over two years folic acid has been the subject of investigations which looked as if at any moment they might result in a major therapeutic advance. In October, 1943, Daft and Sebrell[1] described the successful treatment of granulocytopenia and leucopenia in rats with crystalline folic acid. They produced agranulocytosis by feeding the rats on a diet containing 1 per cent. sulphaguanidine or sulphsuxidine. This constituent reduced bacterial activity in the intestine and therefore reduced the formation of substances essential for nutrition. As a result, after a variable length of time (30—122 days) there was a reduction in the leucocyte and particularly in the granulocyte count. It may be noted that the diet contained thiamin (B^1) pyridoxine, riboflavin, calcium, pantothenate, nicotinic acid, choline chloride, and biotin. When the leucopenia was established, four days' administration of folic acid raised the white count from a mean figure of 2,700 to 14,400 per c.mm., and the percentage of granulocytes from 1 to 39. This was the first discovery. It was a result of observations that leucopenia was cured in the rat by concentrated extracts from liver, the preparation of which suggested that the substance stimulating leucocyte production might be the growth factor, for *Lactobacillus casei*[2]; this was later named folic acid.[3] When folic acid was crystalized,[4] therefore, it became possible to test and establish the suggestion.

There has been, however, another direction in which folic acid has become a substance of great interest. Its crystallization led to its identification with Vitamin Bc—an anti-anaemia factor for the chick.[4] The outcome of the indication that folic acid was concerned not only with the production of the white cell in the bone marrow but also with the production of the red cell is that Spies[5] has recently described the successful treatment of macrocytic anaemia with folic acid. Spies has been working in the southern part of the United States at a centre he established in Alabama, where severe malnutrition is still relatively common.

The results are that, out of 42 cases of macrocytic anaemia, 26 responded to administration of folic acid, and of these five were patients with Addisonian pernicious anaemia. This effect of folic acid in pernicious anaemia is of the greatest interest, and suggests that the position of Castle's intrinsic and extrinsic factors will require reconsideration. Among the other patients successfully treated were 8 with sprue, in whom not only did the anaemia disappear but the liquid fatty stools turned to solid brown faeces.

The Importance of Wholemeal Bread

Wholemeal bread contains iron—the mineral salt essential for the construction of haemoglobin, the pigment in the red blood cells. Anaemia is an all too common disease in England and several surveys have shown appallingly low percentages of haemoglobin. It should be remembered that 100 per cent. haemoglobin is the average, not the optimum. This can be illustrated best by an example of a much too infrequently described health condition:—

"A well-built, thick-set boy, well above the average intelligence, first attracted my attention when he won the quarter-mile: he was in the XV. He weighed his food for a week in the holidays and ate 4,400 calories daily: his haemoglobin was 120 per cent. He has since joined the Royal Navy and the last I heard of him was that he had been awarded the D.S.C. for conspicuous bravery."

His haemoglobin was 120 per cent. because he had ample choice in his diet of iron and protein, for the globin in haemoglobin is important as well as the iron. Twelve others weighed their food and their haemoglobins averaged over 100 per cent., the only boy with a figure below 100 being a "food faddist." The point I am trying to make is that iron is in the food and that in bread and vegetables it is in a form easily assimilated. Girls need more iron than boys because they lose considerable amounts during menstruation. Every source should be tapped, and wholemeal bread is one.

THE SCHOOL IN THE WOODS

——at Southway, near Guildford

THE importance of fresh air, good food and wise training during the formative years of childhood, is now generally recognized in this country. The value of beautiful surroundings and opportunities for creative activity, though not as widely appreciated, is rapidly becoming so, and at Westborough Nursery School, Southway, every effort is made to provide all these advantages for between forty and fifty children.

Situated in the Surrey woods, near Guildford, the school—opened in April, 1941, as the first war-time nursery, under the Guildford Education Committee—was taken over by the Surrey County Council in April, 1946. Originally intended for children of women war-workers only, it is now open to all. As it is a day nursery, with hours from 9 a.m. to 4 p.m., and school terms, the children come from the immediate neighbourhood. The principal, Miss Margaret Goldsmith, formerly of Vienna, is keenly interested in child psychology and art, and many of the carefully chosen toys have been designed by Miss Goldsmith (who holds a degree in psychology and modern languages) and made by the staff.

THE THYROID GLAND*

By G. A. BAGOT WALTERS, F.R.C.S.

BEFORE discussing the treatment of goitres I would like to remind you of the importance of the thyroid gland. If the pituitary gland is recognized as the leader of the "endocrine orchestra," surely the thyroid should be considered the "first violin." As it is closely associated with all phases of a woman's life, puberty, menstruation and menopause, it is not surprising that the incidence of disease in this gland is higher in women than in men.

Thyroid deficiency, or hypothyroidism, in children produces cretinism, with stunted growth and feeble mind; in adults myxoedema with increase in bulk, dry rough skin and falling hair. These conditions may be controlled by adequate thyroid therapy.

Goitres may be classified as follows :—

Simple { Diffuse or Parenchymatous.
Nodular Adenomata—Cysts.

Toxic { Primary Toxic Goitre—Graves' Disease.
Secondary Toxic Goitre to Adenoma of Thyroid.

Simple Goitre with Diffuse Enlargement.—For prophylaxis an adequate amount of iodine in the diet is important. Iodised salt may be necessary in certain inland places, *i.e.*, Derbyshire. Iodine may be given in treatment and thyroid extract is sometimes useful.

Simple Goitre with Nodular or Cystic Enlargement.—This will not respond to iodine therapy and X-ray treatment is unsatisfactory. Operation is the best line of treatment, to protect the patient from toxic or malignant changes, and may also be undertaken to relieve pressure, or for cosmetic effect.

Toxic Goitre.—If primary, this does not necessarily cause much enlargement. Diagnosis may at first be missed owing to no palpable or obvious enlargement being present. Treatment should not be delayed unduly; poor results in the past have often been due to delay in diagnosis, or fear of operation. The disease throws much strain on the heart and nervous system, and fear increases the cardiac burden.

Radium or deep X-ray treatment is now condemned; the results are uncertain, and the subsequent increase in fibrous tissue makes later operation more difficult.

Medical Treatment

Iodine is of some value if given in small doses for a short period. It tends to make the gland harder and more adherent if given for long, making subsequent operation more difficult, and depriving both patient and surgeon of the benefit of a short course immediately prior to operation. Thiouracil is a new drug, which acts by preventing the formation of the toxic substance in the gland known as thyroxine. Thiouracil improves the patient's general condition and slows the pulse rate, but must be used under careful supervision as it destroys white blood cells. Frequent blood slides should be examined to guard against this danger. Thiouracil usually causes enlargement of the gland at first, making it dangerous to use where pressure symptoms are present. It has to be taken for a long period with no guarantee of cure. A potent weapon, it is too soon yet to assess its full worth, but its main field of usefulness may well prove to be in making the patient's condition safe for surgery.

Surgical Treatment

To my mind surgery remains the treatment of election. The parts played by surgeon, anaesthetist, physician and nursing staff, are all of equal importance in ensuring ultimate success.

The treatment may be divided into three phases. During the first or pre-operative phase the patient should be confined to bed, if possible in a side ward with other "thyroid" patients. To see someone with the same disease getting better helps to combat fear of operation. The surgeon and nursing staff should gain the patient's confidence. Extra fluids and glucose should be given, and adequate sleep obtained by means of luminal, or other barbiturates. The physician should advise on the state of the heart, and he may prescribe digitalis. Any dental sepsis is eradicated. Lugol's iodine should be given during the last ten to fourteen days.

The Operation

For simple goitre, intra-tracheal gas and oxygen may be used and is indicated for large glands, or where there is some degree of obstruction. For toxic cases, in my experience, local anaesthesia is best. Adequate premedication is necessary. Omnopon and scopolamine, with dosage calculated from the patient's body weight, should make the patient drowsy on arrival in the theatre. Good lighting, gentle handling and adequate haemostasis, for which we employ diathermy, are essential. Seven-eighths of the gland should be removed, a wedge on either side being left to protect the recurrent laryngeal nerves. All four arteries should be tied off to cut down the blood supply to the stump. Drainage tubes make an ugly scar and should be avoided unless oozing is excessive. Clips should be used to secure the skin edges, with an elastoplast dressing to provide gentle pressure.

Post-Operative Care

Allow the patient to have one pillow on return to the ward; a rectal saline with iodine, minims 40, should be given at once. The patient may be propped up in bed as soon as her condition allows. Heroin should be given for restlessness, and the dose may be repeated once. One of the main troubles following this operation is tracheitis. Reassure the patient that the condition is not serious; give aspirin gargles, scuroform anaesthetic tablets to suck; or linctus heroin, may ease the condition.

Clips should be removed after 36 hours and the drain, if any, on the fourth day. The patient may get up about the eighth to the tenth day, but should be warned not to expect too great an improvement at first. Time is necessary for readjustment of the glands, and, in bad cases, for the heart muscle to recover. At least four weeks' convalescence is necessary after the patient's discharge from hospital.

Book Reviews

A POCKET OBSTETRICS.—*By Arthur C. H. Bell, M.B., B.S., F.R.C.S., M.R.C.O.G. (J. and A. Churchill, Limited, 104, Gloucester Place, Portman Square, W. Price 8s. 6d.)*

This little book is something of a "potted meat" edition of Queen Charlotte's text-book, and this may account for such omissions as the key to diagram I. Presumably such handbooks have their uses for pre-examination cramming, but inevitably explanation is wanting, and symptoms, treatment, etcetra, become simply bald statements of fact. With no teaching emphasis this book is of little use to pupil midwives, except for a last minute revision; and with so little depth of little use as reference for the qualified midwife.

Diploma in Nursing, University of London.

SURGICAL NURSING AND AFTER TREATMENT.—*By H. C. Rutherford Darling, M.D., M.S. (Lond.), F.R.C.S. (Eng.), F.R.F.P.S. (Glasgow). (J. and A. Churchill, Limited, 104, Gloucester Place, W.1. Price 12s. 6d.)*

The ninth edition of this very familiar book has been published and, as with all previous editions, it is proving a useful addition to a nurse's library, containing as it does such a mass of information upon practically every field of surgical nursing.

Some of the surgical appliances shown are probably only of interest from an historical point of view : for example, the frame used for nursing a patient after laminectomy; in view of the enormous strides made in this branch of surgery, I very much doubt whether this apparatus would ever be necessary and taking into consideration the large number of new methods and treatments a nurse has to assimulate I think it is a pity to overload an otherwise excellent book with material which in the future perhaps will not be used.

HOSPITAL DIETETICS

Discussion by the Nutrition Society, Scottish Group

At the sixteenth scientific meeting of the Nutrition Society, Scottish Group, held at the Royal Infirmary, Edinburgh, the principal speakers were Professor W. W. H. Cruickshank, M.D., F.R.S.E.; Professor of Physiology, Aberdeen; Dr. Alexander Lyall, M.D., F.R.C.P., Department of Clinical Medicine, the University, Aberdeen; and Miss Ruth Pybus, S.R.N., (until recently sister dietitian, Edinburgh Royal Infirmary). In the Chair was Professor David Murray Lyon, F.R.S.(Ed.), F.R.C.P., D.Sc.(Ed.), M.D., D.P.H.; Professor of Clinical Medicine, University of Edinburgh.

Diets in 1742

In his introductory address **Professor Murray Lyon** remarked that dietetics had been of considerable importance in hospitals for centuries, but that dietetic departments as such were of very recent development. He quoted some very interesting examples of the diets provided for the patients in Edinburgh Royal Infirmary in 1742 and also mentioned the so-called 'extra' diet of 1843. This diet while providing about 3,000 calories was very largely carbohydrate.

A very interesting point which Professor Murray Lyon made was that in the course of dietary investigations carried out in certain hospitals during the first year of the recent war, almost one third of the total calories consumed by the patients were supplied by the patients' friends, in the form of jam, cakes, sweets, etcetera. The dietary investigations revealed also that the cheese ration was not always fully used, especially in the female wards. Another point noted was that the Vitamin C was largely destroyed in cooking or method of distribution to the wards.

Finding the Facts

Professor W. W. H. Cruickshank made some most interesting observations in the course of his talk on "Dietary Surveys in Maternity Wards of Scottish Hospitals." These surveys were carried out in the largest post-natal wards of all types of hospital; local authority, voluntary and Emergency Medical Service. For purposes of presentation of data the hospitals were classified into "large city," "small-town" and "rural" hospitals. The surveys were aimed at finding out the total calories consumed by the patients and the nutritive value of the food supplied by the hospital. In order to carry out such an investigation standards of comparison are necessary and a standard or suggested diet was devised, the nutrients of which were termed the "Target." The "Target" was as follows:—total calories 2546; carbohydrate 298 gm.; protein 99 gm.; animal protein 60 gm.; fat 108 gm.; calcium 1.7 gm.; iron 13 mgm.; vitamin A 3429 I.U.; thiamin 1.3 mg.; riboflavin 2.4 mg.; nicotinic acid 27 mg.; ascorbic acid 36 mg.

Protein Deficiency

Surveys revealed that the average diet as supplied by the hospital was just under 2,000 calories and that 82 per cent. of the large city hospitals were under the "Target" figure while only one city hospital gave a diet higher than 2,500 calories. The position was slightly better in small-town and rural hospitals. Carbohydrate was fairly good but the total protein supplied in the hospital diet was on an average 75 gm. instead of 99 gm. as suggested. This deficiency was in some measure due to rationing difficulties and the variability of the protein content of certain foods, *e.g.*, bacon. The average amount of fat provided was 76 gm. as compared with the "Target" of 108 gm. In the course of the surveys it was noted again that a fair proportion of the food consumed by the patients was brought to them by their friends: approximately 18 per cent. of the carbohydrate and 16 per cent of fat eaten were from such a source.

It is of considerable value to note from what foodstuffs hospitals supply the essentials in the diets. 65 per cent. of the total calcium is derived from milk, while about 4 per cent. is from good mixed vegetable broth. Of the iron intake a large part was from "national bread," a fair amount from broth and a not-to-be-despised amount from cocoa, of which greater use should be made. The chief sources of Vitamin A were milk, and margarine, while broth again was valuable. It was noticeable that only five hospitals during the week of survey gave the patients carrots. Vitamin C was derived largely from milk and potatoes.

Diet plays an important part in the restoration of a patient to health and the hospital kitchen makes its contribution to healing as well as the wards: Above: the modern kitchen at the London Hospital which cost £7,000, and the chefs and domestic staff, whose skill gives patients and nurses a balanced and interesting diet

In commenting on the hospital surveys **Dr. C. P. Stewart** said that the target diet was good and within the purchasing power of all hospitals, and that the surveys were carried out while national bread was being used, and that if pre-war white bread had been in use instead, the Vitamin B intake would have been 30 per cent. lower.

Dr. Lyall in discussing "Remedial Diets and their Difficulties" pointed out that about 40 per cent. of general hospital diets are "special." In carrying out dietetic treatment it was necessary to supply the proper number of calories, keep a proper balance, give variety and obtain the co-operation of the patient both as an in- and out-patient. Articles in that diet must be available for the patient and within his purchasing-power.

Diabetic Diets

Diabetic diets were at present one of the most important considerations as the disease was so common and was on the increase. These diets had changed very considerably in recent years and while the same number of calories might still be provided there was a great increase in the amount of carbohydrate prescribed and a reduction in the fat, making the diet much more normal and palatable. This change in diet was demonstrated in the Dietetic Department by **Miss Buchan** of Edinburgh Royal Infirmary. One factor in which the diabetic's diet tends to be deficient at times is vitamin C. This is due to the scarcity and high cost of vegetables in parts of the country at certain times. During the years of rationing, diabetics had been granted extra allowances of meat, fat, cheese, and milk, and this had enabled them to adhere to their diets reasonably well. Obesity diets had been difficult as the obese patients had no concessions and again the problem of vegetables was of importance. Patients suffering from steatorrhoea had been granted extra rations of protein, as had patients with certain kidney conditions. There had been no allowance of extra milk for patients suffering from osteoporosis where added calcium would have been beneficial.

With regard to this question of extra milk, Professor Davidson pointed out for the interest of members that 54 per cent. of our country's milk production was at present going as "priorities" but only one-third of that was for illness, as school milk, etcetera is a "priority."

Miss Pybus in speaking of the development of hospital dietetic departments, referred to the changes which had taken place in diets in recent years and recalled the time, not so very far distant, when patients with peptic ulcers were fed rectally with great fervour, being given chicken tea, switched eggs, café au lait, and poor nephritics with gross albuminuria never saw an egg but were fed on milk and water, and chicken tea. With reference to the former diets of patients with peptic ulcers Miss Pybus said she often wondered if the recurring haematemesis was not due to scurvy from lack of vitamin C rather than due to the ulcer. Miss Pybus, also referred to the recent changes in diabetic diets already mentioned.

INSULIN'S SILVER JUBILEE

Professor Charles Best, one of the discoverers of insulin, came to London from Canada recently to attend the Jubilee Celebrations of the Diabetic Association at the Royal Institution. In pre-insulin days adult diabetics could expect no more than 4 or 5 years of life. To-day, thanks mainly to the work of Dr. Banting and Professor Charles Best (who were awarded the Nobel Prize for their work), diabetics—and there are 200,000 in Britain alone—need be under no greater handicap than the person with short sight. Many nurses will remember the impact of this dramatic discovery on the medical world 25 years ago; all will know from experience how much the diabetic owes to those pioneers whose discovery meant the difference between life and death.

REVISED SALARIES FOR MENTAL NURSES

—Further Recommendations of the Mental Nurses Sub-Committee of the Nurses Salaries Committee

THE Mental Nurses Sub-Committee have now completed their revision of the salary scales for grades of Mental Nurses and they recommend in Notes No. 7 (H.M.S.O. price 2d.) the revised scales of salaries and emoluments set out in the Tables below for the grades of Male and Female Mental Nurses indicated:

TABLE I. FEMALE NURSES EMPLOYED IN MENTAL HOSPITALS AND MENTAL DEFICIENCY INSTITUTIONS

Post	Annual Salary	Emoluments	Total
In a Mental Hospital or Institution approved as a training school for mental nursing or mental deficiency nursing by the General Nursing Council or Royal Medico-Psychological Association.			
Matron—			
1,330 beds and over	From £430 to £650.*	£250	From £680 to £900
670—1,329 beds	From £405 to £625*	£200	From £605 to £825
500—669 beds	£380 rising by annual increments of £30 to £530	£200	£580—£730
330—499 beds	£330 rising by annual increments of £25 to £480	£175	£505—£655
Under 330	£280 rising by annual increments of £25 to £405	£150	£430—£555

* *This is a range, not a scale. The starting point within the range to rest in each case with the hospital authority. Six annual increments of £30 to be given provided the maximum of the range is not exceeded.*

Deputy Matron—formerly known as Assistant Matron			
1,330 beds and over	From £325 to £425*	£150	From £475 to £575
670—1,329 beds	From £320 to £420*	£150	From £470 to £570
500—669 beds	£320 rising by annual increments of £10 to £360	£140	£460—£500
330—499 beds	£320 rising by annual increments of £10 to £360	£140	£460—£500
Under 330 beds	£290 rising by annual increments of £10 to £330	£130	£420—£460
Senior Assistant Matron—formerly included in the definition "Assistant Matron."			
1,330 beds and over	From £305 to £405*	£150	From £455 to £555
670—1,329 beds	From £300 to £400*	£150	From £450 to £555
500—669 beds	£300 rising by annual increments of £10 to £340	£140	£440—£480
330—499 beds	£300 rising by annual increments of £10 to £340	£140	£440—£480

* *This is a range not a scale. The starting point within the range to rest in each case with the hospital authority. Four annual increments of £10 to be given provided the maximum of the range is not exceeded.*

Post	Annual Salary	Emoluments	Total
Qualified Senior Sister Tutor	£320 rising by annual increments of £20 to £420	£150	£470—£57[illegible]
Qualified Sister Tutor in sole charge	£290 rising by annual increments of £20 to £350	£140	£430—£49[illegible]
Qualified Assistant Sister Tutor	£260 rising by annual increments of £15 to £320	£140	£400—£46[illegible]
In a Mental Hospital or Institution not approved as a training school			
Matron—			
500 beds and over	£305 rising by annual increments of £25 to £455	£200	£505—£655
330—499 beds	£280 rising by annual increments of £25 to £405	£150	£430—£555
165—329 beds	£270 rising by annual increments of £20 to £350, followed after one year at £350 by one further increment of £10 to £360	£150	£420—£510
85—164 beds	£260 rising by annual increments of £20 to £340, followed after one year at £340 by one further increment of £10 to £350	£150	£410—£500
Under 85 beds	£260 rising by annual increments of £20 to £320, followed after one year at £320 by one further increment of £10 to £330	£150	£410—£48[illegible]
Deputy Matron formerly known as Assistant Matron			
500 beds and over	£290 rising by annual increments of £10 to £330	£130	£420—£46[illegible]
330—499 beds	£270 rising by annual increments of £10 to £320	£130	£400—£45[illegible]
Under 330 beds	£250 rising by annual increments of £10 to £320	£130	£380—£45[illegible]
In a Mental Hospital or Institution whether or not approved as a training school			
Assistant Matron — including the post formerly designated "Departmental Sister"	Ward sister's salary (£180 rising by annual increments of £10 to £240, followed after 5 years at £240 by a further increment of £20 and after another 5 years by an additional increment of £20) plus an allowance of £40	£120	£340—£4[illegible]
Home Sister	Ward Sister's salary (£180 rising by annual increments of £10 to £240, followed after 5 years at £240 by a further increment of £20 and after another 5 years by an additional increment of £20) plus (at employing authority's discretion) an allowance of £0—£30 or, in exceptionally large units, £40	£120	£300—£4[illegible] or £4[illegible]
Housekeeping Sister (*with or without housekeeping certificate*)	Ward sister's salary (**as for Assistant Matron**) without the additional allowance of £40	£120	£300—£4[illegible]

TABLE II.—MALE NURSES EMPLOYED IN MENTAL HOSPITALS AND MENTAL DEFICIENCY INSTITUTIONS

Post	Annual Salary—Non-Resident	Annual Salary—Resident	Emoluments—Non-Resident	Emoluments—Resident
In a Mental Hospital or Institution approved as a Training School				
Chief Male Nurse—				
1,330 beds and over	From £525 to £665*	From £390 to £530*	£5	£140
570—1,329 beds	From £500 to £640*	From £365 to £505*	£5	£140
* *This is a range, not a scale. The starting point within the range to rest in each case with the hospital authority. Four annual increments of £30 to be given thereafter, provided the maximum of the range is not exceeded.*				
500—669 beds	£495 rising by annual increments of £30 to £615 ...	£360 rising by annual increments of £30 to £480 ...	£5	£140
330—499 beds	£470 rising by annual increments of £30 to £590 ...	£345 rising by annual increments of £30 to £465 ...	£5	£130
Under 330 beds	£445 rising by annual increments of £30 to £565	£320 rising by annual increments of £30 to £440	£5	£130
Deputy Chief Male Nurse—				
1,330 beds and over	From £455 to £505*	From £340 to £390*	£5	£120
570—1,329 beds	From £445 to £495*	From £330 to £380*	£5	£120
500—669 beds	£435 rising by annual increments of £10 to £475	£320 rising by annual increments of £10 to £360 ...	£5	£120
330—499 beds	£425 rising by annual increments of £10 to £465 ...	£310 rising by annual increments of £10 to £350 ...	£5	£120
Under 330 beds	£415 rising by annual increments of £10 to £455 ...	£305 rising by annual increments of £10 to £345 ...	£5	£115
Senior Assistant Chief Male Nurse formerly included in the definition "Deputy Chief Male Nurse"—				
1,330 beds and over	From £435 to £485*	From £320 to £370*	£5	£120
570—1,329 beds	From £425 to £475*	From £310 to £360*	£5	£120
500—669 beds	£415 rising by annual increments of £10 to £455 ...	£305 rising by annual increments of £10 to £345 ...	£5	£115
330—499 beds	£405 rising by annual increments of £10 to £445	£300 rising by annual increments of £10 to £340	£5	£110
Qualified Male Senior Tutor ...	£465 rising by annual increments of £15 to £555, followed after one year on £555 by a further increment of £10	£340 rising by annual increments of £15 to £430, followed after one year on £430 by a further increment of £10	£5	£130
Qualified Male Tutor in sole charge	£425 rising by annual increments of £10 to £485 ...	£310 rising by annual increments of £10 to £370 ...	£5	£120
Qualified Assistant Male Tutor ...	£395 rising by annual increments of £10 to £455	£285 rising by annual increments of £10 to £345	£5	£115
* *This is a range, not a scale. The starting point within the range to rest in each case with the hospital authority. Four annual increments of £10 to be given thereafter, provided the maximum of the range is not exceeded.*				
In Mental Hospitals or Institutions not approved as Training Schools				
Chief Male Nurse—				
500 beds and over	£475 rising by annual increments of £25 to £575 ...	£340 rising by annual increments of £25 to £440 ...	£5	£140
330—499 beds	£450 rising by annual increments of £25 to £550	£325 rising by annual increments of £25 to £425	£5	£130
165—329 beds	£425 rising by annual increments of £25 to £525	£300 rising by annual increments of £25 to £400	£5	£130
85—164 beds	£425 rising by annual increments of £20 to £505 ...	£300 rising by annual increments of £20 to £380 ...	£5	£130
Under 85 beds	£425 rising by annual increments of £20 to £485	£300 rising by annual increments of £20 to £360	£5	£130
Deputy Chief Male Nurse—				
500 beds and over	£405 rising by annual increments of £10 to £455	£300 rising by annual increments of £10 to £350 ...	£5	£110
330—499 beds	£395 rising by annual increments of £10 to £445	£295 rising by annual increments of £10 to £345	£5	£105
Under 330 beds	£380 rising by annual increments of £10 to £440	£285 rising by annual increments of £10 to £345	£5	£100
In a Mental Hospital or Institution whether or not approved as a training school				
Assistant Chief Male Nurse— including the post formerly designated "Departmental Nurse"	Charge Nurse's salary £312 rising by annual increments of £13, followed after 2 years at £364 5s., by a further increment of £15 12s. and after another 3 years by an additional increment of £15 12s.), plus an allowance of £41 12s.	Charge Nurse's salary (£217 2s. rising by annual increments of £13, followed after 2 years at £269 2s., by a further increment of £15 12s. and after another 3 years by an additional increment of £15 12s.), plus an allowance of £41 12s.	£5 4s.	£100 2s.

NOTES TO TABLE I

1. The number of beds for the purpose of determining the salary of the Matron, Deputy Matron and Senior Assistant Matron shall be determined as in Note 2 to Table I in the Sub-Committee's Report.

2. If a Senior Sister Tutor, Sister Tutor in sole charge or Assistant Sister Tutor is not qualified in accordance with the definition in paragraph 26 of the Report of the Mental Nurses Sub-Committee, the scale of salary given above should be reduced by £30 throughout.

NOTE TO TABLE II

If a Male Senior Tutor, Male Tutor in sole charge or Male Assistant Tutor is not qualified in accordance with the definition in paragraph 41 of the Report of the Mental Nurses Sub-Committee, the scale of salaries given above should be reduced by £30 throughout.

TWO AND A HALF YEARS' EXPERIENCE IN A CIVIL ASSEMBLY CENTRE IN CHINA

By J. B. ELLISON, S.R.N.

I WAS in two internment camps in the two and a half years. The first was a small camp of three hundred people; the second numbered 1,100; the big camp was one of half a dozen in the Shanghai area; they varied considerably. In one camp internees were housed in several scattered buildings in large grounds, in another in huts on ground that easily flooded. We were in an old factory and soon after internment we visited each other and compared notes.

Soap and Water

Before the period in Shanghai I was among others sent on a long journey out of Shanghai. It seemed a strange place to send us, but very interesting. The last part of the journey was up the Grand Canal and our destination was Yangchow—associated with Marco Polo, the first European to visit China proper. It was while digging deep garbage pits there, that we came across pieces of old broken China pottery which was recognized by some who knew, to date back to the Sing dynasty. The big problem there was water. It came from wells and the canal and had to be chlorinated and conserved and hot water was very scarce. (We sometimes borrowed someone else's rinsing water for a first washing water.) Soap, too, was scarce and we also sometimes handed on soap-suds. We had three ways of conserving soap. We could either cover one side of the soap with silver paper or press the tin cap of a bottle into the soap cake and put it down always on that side, or by putting a cake of soap into a bag and rubbing it in the bag, it went further that way. We were glad to leave this place before the winter set in. But the summer there in the lovely grounds of the school we were in had not been bad.

The menu for all camps was stew, stew, stew—so we called it S.O.S. (same old stew). In both camps we had a variety of people—both professionally and nationally. Often one has been asked, "How did you fill in your time?" For my part I could have done with much more time to take advantage of all the lectures we could attend, not to mention private reading, etcetera. Most of the professions were needed in the camp; the engineers, electricians, teachers, lecturers, musicians, artists of all sorts, sportsmen and medical men and authors were all busy. The one man who was not busy was the official hangman of the Shanghai jail. There were other jobs which did not claim professional people, but were very important—namely, what someone named "the Drain's Trust"—nobly carried out by a squad of men, one at least of whom could have appeared on the Brain's Trust.

Home and Freedom

By the time we left, we had made many friends and many felt they had benefitted a lot by lectures, contacts and experiences of all sorts, but we were one and all glad to get outside the barbed wire and into touch with the rest of the world again. And oh! the joy of that first night in England, falling asleep in a soft double bed and waking up to find oneself in a room of one's own instead of with 37 others.

A Big Event

Middlesex Hospitals' Prizegiving

"BEYOND the technical side—what we should call in the nursing and medical circles—is the psychological side," said Lord Inman, of Knaresborough, Chairman of Charing Cross Hospital, to nurses of the eight Middlesex hospitals at the annual prizegiving recently. It was held in the beautiful old Westminster Guildhall. "More is demanded to-day than merely the treatment of the body. The condition of the mind has a very powerful effect on the condition of the body" continued Lord Inman, and, as an example of this, he quoted from his personal experience. The morning of his operation in a nursing home of some repute, his nurse came to him, and said in a mournful voice, "the fateful hour draws near!" "We should be constantly on our guard," he continued, "a few careless words can cause serious damage. You have a double ministry to perform; the material or treatment of the body and the non-material or treatment of the mind, and one is as important as the other."

Hostesses and Guests

Lord Inman likened the hospital to a guest house, which, indeed, is the original meaning of the word "hospital." The nurses are the hostesses, the patients, their guests; they should be treated as such, with patience and understanding. There is always a grave tendency for a nurse to regard her patients merely as "cases," not as individuals. Lord Inman congratulated the nurses on their successes, and wished them all happiness in their future lives. "You have embarked upon a great life. For sheer adventure and self-sacrifice, I know of no other work to compare with it." A replica of the gold medal was presented to the matron of Redhill County Hospital, Miss E. R. Wheeldon. Lord Inman presented, in bulk, the awards gained by nurses successful in the twenty-ninth examination, to the matrons of the respective hospitals.

Miss Musson proposed, and Miss White seconded (gold and silver medalists) a vote of thanks to Lord Inman.

The medals and certificates for the thirtieth examination were presented to the following: *Gold medal*—Miss P. M. Musson, Redhill. *Silver medal*—Miss M. I. Cummings, Redhill, and Miss J. W. White, Harefield. *Pass with honours*—Miss E. M. Rapp, West Middlesex; Miss O. M. Humm, Redhill; Miss M. Y. Shrimpton, Central Middlesex; and Miss C. Gale, Central Middlesex. Sixty-seven passed with credit and sixty passed. To all these nurses we offer our sincere congratulation.

OBITUARIES

Miss M. P. James

It is with regret we announce the death at the Military Hospital, Horley, of Miss M. P. James, sister, Q.A.I.M.N.S. Reserve. Miss James was a trainee of Bristol Royal Infirmary, and had served in Gibraltar, North Africa and Italy.

Miss E. B. Rice

It is with sincere regret we announce the death of Miss E. B. Rice, matron of the Willows Auxiliary Hospital, Preston, who died recently, within a month of her retirement date. Miss Rice was a trainee of Preston Royal Infirmary, where she served also as a ward sister and night sister. She was appointed matron at the Willows Hospital in 1928, a position she held at the time of her death, which took place in her old training school.

"Nursery Provision" — a Conference

THE National Society of Children's Nurseries and the London Women's Parliament held a joint conference recently on Nursery Provision, To-day and To-morrow, under the Chairmanship of Miss Leah Manning, M.P., who deputised for Miss Kershaw. The Conference, which was very well attended, heard messages of support from many well known people, including the Minister of Health, The Rt. Hon. A. Bevan, Lady Megan Lloyd George, M.P., Professor Jean Young, Dr. Haden Guest, M.P., Professor Sir Charles Reilly, as well as from Trade Unions Shop Stewards Committees and Co-operative Guilds.

The expansion of the present nursery system was strongly urged, as was the re-instatement of the 100 per cent. grant, 50 per cent. from the Ministry of Health and 50 per cent. from the Ministry of Labour. It was also stressed that nursery schools should be included in all development plans for education. The salaries and hours of staff should be reviewed by the Ministries of Health and Labour was another point brought forward, as well as the question of a recruitment campaign in the near future. That not more than 1s. per day should be the cost to mothers, and that facilities regarding hours and holidays to meet the need of the working mother should be considered where nursery schools are set up, were all resolutions which were carried unanimously.

FOR YOUR DISCUSSION GROUP

The Bureau of Current Affairs, 117 Piccadilly, W.1, announce that the first series of Photographic Exhibitions are now available, each exhibition consisting of 12-20 coloured panels about 18 in. × 14 in. each. These are intended to play a helpful part in discussion groups and the like, and cover a good range of subjects which will doubtless be expanded in time. At present they have exhibitions on the symphony orchestra, the theatre, French paintings, scientists at work, industrial Britain, etcetera, and the hire charge for a four weeks' period varies from 3s. 6d. to 5s. In addition, there are special fees for longer periods. Nurses' recreational clubs planning their winter programmes should find these a helpful innovation. For further particulars they should write to the address above.

EXAMINATION RESULTS

INDUSTRIAL NURSING EXAMINATION JULY 1946, LONDON

The following have gained the Industrial Nursing Certificate of the Royal College of Nursing:

Distinction in Whole Examination.—Ogden, K. M.

Pass in the Health of the Industrial Worker, the Work of the Nurse in Industry and the Modern Industrial System—Atfield, M. F., ‡Barkley, A. M. E., Blakeway, D. E. E., Bowen, M. A., *Bowman, M., Burbidge, D., *Chatfield, F. E., Craig, M. C., Drummond, M., Ferries, A., Grant, C. E., Hanson, D. M., Heesom, P. H., Keirl, K., Leggett, E., Lewis, K. B. M., McGarry, B., McManus, M. G., Norton, I. F., Paterson, C. M., Plumridge, M. L., Rockcliffe, B. E., Rose, V. M., Smith, M. D., Wall, B., Wood, J. C.

Pass in the Health of the Industrial Worker and the Work of the Nurse in Industry.—Palmer-Roberts, M. H.

*Distinction in the Work of the Nurse in Industry.

‡Distinction in the Modern Industrial System.

Note. Owing to difficulties with printing the certificates we have not be sent out for several months.

THE ROYAL SANITARY INSTITUTE LIVERPOOL

At an examination for **Health Visitors,** being the examination approved by the Minister of Health, held in Liverpool on 20th, 21st and 22nd June, 1946, thirty-nine candidates presented themselves. The following thirty-one candidates passed the examination: Miss E. Bassett, Miss J. Bending, Miss I. Bond, Miss M. Burke, Miss E. F. Carter, Miss A. E. Clark, Miss M. W. Clarke, Miss F. Durham, Miss B. S. England, Miss E. Farley, Miss J. Goulding, Miss J. Heggie, Miss E. Hopkins, Miss M. J. Hughes, Miss M. Jay, Miss M. H. Johnson, Miss J. Littlemore, Miss W. C. McGowan, Miss D. E. McMillan, Miss D. Maltman, Miss M. B. Morgan, Miss M. T. Murphy, Miss J. Pate, Miss E. Redfern, Miss E. L. Roberts, Miss E. Roche, Miss E. Smith, Miss D. M. Strickland, Miss I. A. Taylor, Miss E. W. Walker, Miss A. Williams.

Post-War Bread—Brown or White?

By BRYAN LEIGHTON

WITH the eyes of the nation turned to post-war reconstruction a vital question now being asked is "How can the individual contribute to the new world?" State health services, social insurance schemes, town and country planning, etcetera, are reconstruction problems which the man in the street might hope to leave to the experts in Whitehall. This *laissez-faire* attitude, however, can hardly be expected to contribute to a successful return to a healthy peace-time world. A more constructive attitude would be for each individual to ask what he can do to build a fitter nation.

He can help in many ways, the simplest and sanest being to see how he can reconstruct his own life and health. To ensure post-war health he should remember the scientific fact that food is the most important single factor in a man's health. As the simplest food of any nation is its daily bread, we must include in our post-war planning a consideration of our post-war bread. As war-time controls and restrictions are gradually relaxed, people will look for a restoration of peace-time luxuries and with them the pure white loaf. They will automatically associate peace time with white bread and tend to overlook the danger of such loose thinking. They will also forget that, while the National flour was introduced as a war-time measure, this was, from a health point of view, a most logical step, as it meant that consumers of National bread obtained more of the health-giving vitamins and body-building proteins than they did from eating peace-time white bread.

Profit

There is a very serious danger that the traditional consumer preference for a pure white bread will soon be hard at work causing a clamour for the return of the white loaf. This danger is greatly intensified by the thought that a return to pre-war white flour would be welcomed by certain interests who would profit from the greater yield of the "offals" of wheat, resulting from such a course; *i.e.*, the whiter our flour the more offals (bran and seed coat) containing the valuable vitamins and proteins, become available for sale as cattle and pig food.

A simple study of the structure of wheat would do much to clarify the misconceptions about the desirability of a return to a pure white bread. Pre-war flour (70 to 75 per cent. extraction) consisted entirely of endosperm, that is, the starchy portion of the wheat grain separated from the other parts of the grain, *i.e.*, the bran, the aleurone or protein layer, and embryo or wheat germ containing vitamins. Therefore, those who benefitted from the health and body-building properties of wheat were cattle, pigs and poultry, while humans were left with their "denatured" starchy endosperm or white flour.

A Scientific View

Sir Edward Mellanby, secretary of the Medical Research Council, in an article on nutritional science (*British Medical Bulletin*, Vol. 2, 1944, No. 10-11), points out that nutritional scientists are agreed that this policy is wrong. While some American authorities, he writes, suggest as a remedy to the problem that old type low-extraction white flour should be treated with added vitamins which normally occur in wheat, the British school of scientists believe that bread for human consumption should be made of flour containing as much of the wheat berry as is physiologically absorbable. He stresses the need for scientists all over the world to come to an understanding on the optimum composition of bread.

A glance at the accompanying illustration will help to show the seriousness of the issues at stake when wheat is milled and separated into its two marketable fractions, white flour and offal. While the white flour consists almost entirely of starch, the constituents of the offal—vitamin B complex, vitamin E, minerals and proteins—are so important that they need to be separately considered.

Vitamin B Complex.—This term is applied to a group of about six vitamins which occur in the bran and wheat germ. B complex is of vital importance to the body both from a physical health and mental outlook point of view, and for this reason it is sometimes known as the happiness vitamin. It is essential for preserving the health of the nerves and muscles, especially of the digestive tract, and it is so closely associated with the digestion of starchy foods that the more of the latter we eat the more vitamin B_1 we should have. Diets deficient in the B complex lead to nervous and physical exhaustion, loss of appetite, digestive disorders, irritability, mental apathy, depression, etcetera. War-time National bread contains a small amount of artificially added vitamin B.

The nation's simplest and cheapest food, bread should contain the health-giving vitamins and body-building minerals supplied by the whole wheat grain

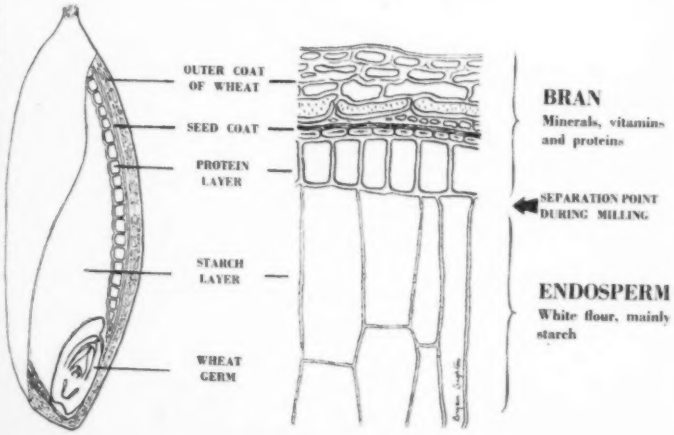
A Cause of Sterility

Vitamin E.—This is called the anti-sterility vitamin, and it occurs in the oily cells of the wheat germ. It has been held that deficiency in the diet of this vitamin leads to a form of sterility which makes child-bearing impossible. Experiments have shown that women suffering from sterility due to vitamin E deficiency have been able to bear children when treated with adequate amounts of the vitamin.

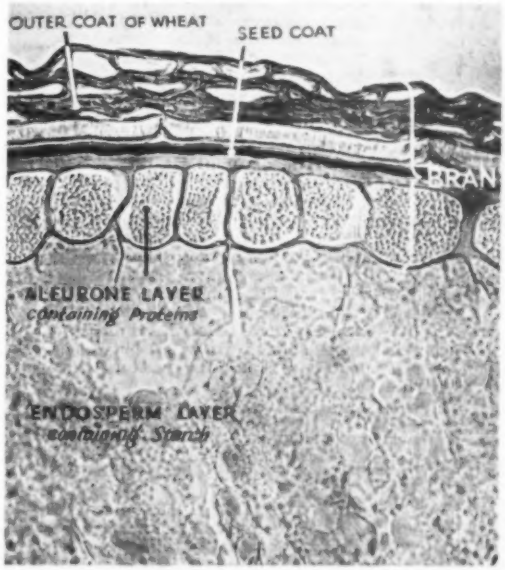
Minerals.—A major portion of the mineral elements in wheat, *i.e.*, calcium, phosphorus, iron, copper, magnesium, occurs in the cells of the bran layers, and tests show a serious loss in the mineral content of wheat flour after milling—in the case of magnesium the

Below: a diagram showing the sectional (left) and microscopic structure of the wheat grain
Right: a transverse section of the wheat grain. It will be seen that valuable minerals, vitamins and protein are in that part of the grain commonly extracted in milling

THE STRUCTURE OF WHEAT



Sectional and microscopic structure of wheat grain



loss is as high as 70 per cent. (Wokes, "Food, the deciding factor"). It was because of the loss of these minerals that war-time experts advised the addition of a small amount of chalk (calcium carbonate) to our present-day National bread.

Proteins.—Although much has been written about vitamins and the public has thereby become very conscious of the part they play in maintaining health, the subject of proteins has not had the attention which its importance merits. Perhaps this is because of the very complex chemical nature of proteins. In simple language, however, proteins are the bricks and mortar of which our body tissues are composed, in contrast to fats and carbohydrates which provide the heating or fuel for the body. Proteins are said to contain the magic of life—ever newly created, ever dying. When proteins are ingested they break down during digestion into simpler components called amino-acids which are absorbed and recombined in the body to form tissue and blood proteins. As the science of proteins unfolds, a wealth of information is accumulating on the importance of proteins in health and sickness. The need to maintain the nation's protein consumption at the beginning of the war was seen by the Ministry of Food, who devoted a large proportion of the available shipping space to the importation of protein in the form of dried eggs, dried milk, canned meats and fish. It seems little short of a tragedy that the Government did not insist that our National flour was of still higher extraction in view of the very high proportion of protein (gluten) which occurs in wheat—in the aleurone layer of the bran and also in the germ. The recognition of the therapeutic value of proteins in surgical shock, severe injuries, burns and during convalescence, has given us one of the most recent forms of medical treatment.

Summing Up

From the above summary of scientific data about that portion of a wheat grain which is rejected as "offal" and given to animals at the expense of human beings, it will be seen that the composition of our future bread—the nation's simplest and cheapest food—is a problem which none can afford to neglect. In considering the question the following additional points should be taken into account :—(1) the proteins of the wheat germ and of the white core of wheat or endosperm are complimentary, each being necessary for the full utilization of the other ; (2) an adequate intake of vitamin B complex is imperative for the correct digestion and assimilation of starch in wheat ; (3) all or most of the objections to whole wheat flour and bread can be overcome by logical thinking; *i.e.*, the coarseness and colour of a high-extraction flour sometimes objected to can largely be overcome by adjustments in milling technique; the difficulty of storing such a flour—complained of by millers—requires a study and mastery of drying and storage problems; (4) the high incidence of digestive disorders and allied complaints is held to be due in a large part to the national consumption of white flour.

What is the obvious answer to the colour riddle of our post-war bread ? Surely it can only be that it is not the colour of bread which matters but its composition. Only bread which is made from a flour rich in all the health-giving vitamins, minerals and body-building proteins can guarantee a healthy nation, and the nearer that such a flour is to a 100 per cent. whole wheat flour, the better will be the national health. Campaigns should be started immediately to re-educate the public on this vital problem, so that instead of worrying about the colour of their bread they will rightfully demand that they get "white bread," "complete vitamin bread," "iron mineral bread," "high-protein bread," "high-sustenance loaf," etcetera—names which should rapidly replace those in use to-day.

Sir Edward Mellanby admirably sums up the correct attitude to the post-war bread problem in his article as follows :—"All that is demanded is that the factor controlling the constitution of bread should be primarily the health of the consumer, and that milling and other interests should be secondary to this condition. Indeed, no nutritional policy adopted by Governments can be wrong if it places the health and the needs of the community as its first and guiding principle."

Appointments

ADLINGTON, Miss M., S.R.N., R.M.N., Certificate of the Royal Medico-Psychological Association, Housekeeping Certificate, matron, Gateshead Mental Hosp., Stannington, nr. Morpeth, Northumberland.

Matron, The Warneford Hosp., Oxford. Assistant matron, Kent County Mental Hosp., Maidstone. Assistant matron, St. Andrew's Hosp., Northampton. Night superintendent, York Clinic, Guy's Hosp., London.

EASTWOOD, Miss F. M., S.R.N., R.M.N., certificate of the Royal Medico-Psychological Association, second assistant matron, Leavesden Hosp., Abbots Langley Watford, Herts.

Trained at Claybury Hosp., Woodford Bridge, Essex, Addenbrooke's Hosp., Cambridge and Oldchurch Hosp., Romford, Essex. Ward sister, North Cambs. Hosp., Wisbech. Surgical ward sister, The Radcliffe Inf., Oxford. Assistant matron, City Mental Hosp., Fulford, York.

JACKSON, Miss E., S.R.N., S.C.M., R.S.C.N., woman inspector, Ministry of Health.

Trained at Hull Royal Infirmary, Edinburgh Royal and Simpson Memorial Hosp., Edinburgh, and Queen Mary's Hosp. for Children, Carshalton, Surrey. Staff nurse, training school ward, Queen Mary's Hosp., Carshalton. Night staff nurse, theatre sister, Hull Royal Inf. Infants' ward sister, St. Mary's Hosp., Manchester. Health visitor, Bradford. Health visitor and school nurse, Shipley, Yorks. Deputy superintendent of health visitors, Manchester.

MAGUIRE, Miss R. E., S.R.N., S.C.M., Diploma in Nursing, London University, Health Visitor's and Sanitary Inspector's Certificate, woman inspector, Ministry of Health.

Trained at University College Hospital, London. Health visitor and school nurse, Croydon. Health visitor, Kensington. Temporary woman inspector, Ministry of Health since July, 1940.

MELROSE, Mr. D. G., S.R.N., Nurse Tutors' Certificate, assistant tutor, North Middlesex County Hosp., N.18.

Trained at Hackney Hosp. Staff nurse and acting charge nurse, Hackney Hosp., E.9.

MIDDLETON, Miss M. H., S.R.N., matron, Ayr County Hosp.

Trained at Western Inf., Glasgow. Administrative sister, Princess Margaret Rose Hosp., Edinburgh. Matron, Royal National Orthopaedic Hosp., London, W.1. Matron, Thames Ditton and District Hosp., Thames Ditton, Surrey. Housekeeping sister, Western General Hosp., Edinburgh.

WROE, Miss F., A.R.R.C., S.R.N., S.C.M., Certificate of the Royal Medico-Psychological Association, and housekeeping certificate, matron, Storthes Hall Mental Hosp., Kirkburton near Huddersfield.

Trained at Rubery Hill Mental Hosp., Birmingham, City Hosp., Sheffield and Nottingham General Hosp. Home sister and sister tutor, "Blackadon," South Devon. Deputy matron, Hollymoor Mental Hosp., Birmingham. Deputy matron, Hollymoor Emergency Hosp. Served in the Queen Alexandra's Royal Naval Nursing Service, 1942-1946.

MANY QUESTIONS—at the meeting of the Society of Registered Male Nurses

THE Society of Registered Male Nurses, meeting in the Council Room of the Royal College of Nursing, on July 31, discussed the status of nurse tutors, the shortage of assistant nurses and the short-comings of hospital notice boards.

Mr. Glavin raised the subject of representation at the numerous nursing recruitment and propaganda exhibitions now being held throughout the country, and proposed that, wherever possible, the Society should acquire stands at these. This proposal, seconded by **Mr. Ambrose,** was carried.

Mr. Glavin raised the question of the status of nurse tutors, holding the view (which he said was shared by many members of the Association of Hospital Matrons), that the tutor should not be subordinate to the matron who, in many cases, did not hold a teaching certificate. He thought that the teaching staffs should be divorced from the administrative side of hospital work, and proposed that the status of nurse tutor should be up-graded to the level of matron in all hospitals, general and mental, approved by the General Nursing Council as training schools. The motion was defeated after a vigorous discussion.

Mr. Dinning felt that too many trained nurses were employed in nursing the chronic sick. Voluntary hospitals could pick and choose their patients, but other hospitals could not. He suggested that the Society should approach the Ministry of Health with a view of getting them to make provision for such patients (possibly in the country) as did not require highly skilled treatment, thus freeing a number of fully trained nurses for other work. **Mr. Craddock** pointed out that under the new Health Services Bill all hospitals were required to take some chronic sick patients, also that if these were removed to the country they would not be able to receive as many visitors as they could in a hospital near home. **Mr. Sayer** stressed the difficulty of finding staff for such Homes, as the shortage of assistant nurses was even more acute!

Mr. Mercer moved that the Society should ask the London County Council to see that all notices of male staff appointments bore the date of issue and a serial number, and also that a space should be reserved on hospital notice boards especially for such notices. There had been many complaints from male nurses that they frequently did not see such notices until after the vacancies had been filled. A serial number would ensure that no notices were missed, and the date of issue would prevent delay in posting on the board. A reserved space would ensure that the notices were not obscured by other announcements. The proposal was carried.

Other items of interest included the announcement that Miss M. F. Hughes—"a very good friend of the Society for many years" had accepted honorary membership; that Mr. Northin, of Bradford, had been created appointments officer to the Society; and Mr. D. T. Lewis, the Society's representative to the National Council of Nurses.

News in Brief

NEWS FROM TORQUAY. Above: *prize-winners at the Torbay Hospital, and left: the first arrival at Torquay's Municipal Maternity Home who arrived before the official opening*
(By courtesy of the Torquay Herald and Express)

Circus goes to Hospital

BERTRAM Mills famous circus gave a half-hour show to the children in Leeds Infirmary.

Highest Birth Rate

THE Registrar-General for England and Wales announces the highest birth rate in the June Quarter for any quarter since 1925, that of 19.2 per 1,000 population.

Ministry of Labour Appointment

MR. A. E. WILSON, a blind man, has been appointed to be senior temporary assistant of its Disabled Persons Branch in London by the Ministry of Labour. Mr. Wilson is an expert on blind welfare and is a native of Lincolnshire.

Northern Ireland Tutors

THE Northern Ireland Ministry of Health has just announced scholarships with maintenance up to £150 for six selected State Registered Nurses, male or female, wishing to become sister tutors.

Clothing Provided for Pupils

A NEW memorandum issued by the Ministry of Education authorizes the provision of clothing for pupils in special boarding schools and free medical treatment for pupils in non-maintained special schools.

For Winter Evenings

MORLEY College, 61, Westminster Bridge Road, S.E.1, begin their new evening class session on September 23, and enrolment dates are September 16—20. Details may be had from the secretary at the above address.

The Hostel of God

IT IS announced that The Hostel of God for the Dying, which was evacuated to Lindfield during the war, is returning to its original home at Clapham Common shortly. The Medical Officer is appealing for more nurses to help the Anglican Sisters of St. Margaret.

Memorial to Plymouth Nurses

PLYMOUTH City Corporation have established a Bursary to commemorate the seven nurses of the City Hospital who lost their lives while on duty during the blitz on Plymouth in March, 1941. £2,000 was raised by the hospital staff during 1945 and the first award has been made to Miss E. M. Wright, S.R.N.

Mentioned for Gallantry

MRS. Vera Hughes, former sister in the Territorial Army Nursing Service, of South Shields, has been mentioned in despatches for gallantry when the hospital ship on which she was serving was bombed and sunk. Although injured herself, Mrs. Hughes tended the wounded and saved a fellow nurse, before she reported her own injuries. Her husband is the doctor who eventually treated her.

Torbay Hospital Prizes

MISS A. M. Parker won the Silver Medal and Miss J. G. Russ the Bronze Medal at Torbay Hospital, and received them from the Mayoress, Mrs. C. T. Bowden.

Satisfactory News

THE Manchester Northern Hospital announced recently that with the more complete nursing staff it has been possible to use all the hospital accommodation, and admission rate is approaching the pre-war figure.

An Australian Visitor

MISS P. S. Church of Peppermint Grove, Western Australia, is coming to England this summer on a nursing scholarship made available by the Australian Red Cross Society under the auspices of the Florence Nightingale International Foundation.

South African Help

READING in the local press that the Taunton and Somerset Hospital, Taunton, would have to close a ward on August 15 because advertisements for student nurses had met with no response, two South African nurses on holiday in England volunteered to help. The closing of the ward has thus been delayed.

Congratulations

MRS Howard-Smith, S.R.N., S.C.M., night superintendent at The Royal Gwent Hospital, Newport, has been mentioned in despatches "in recognition of Gallant and Distinguished service in the Mediterranean Theatre." Mrs. Howard-Smith is a trainee of Charing Cross Hospital, and was called up in the Q.A.I.M.N.S. in 1939.

Bosworth Park Celebrates its 10th Anniversary

Bosworth Park Infirmary was the scene of a happy gathering on July 20, when members of the Leicestershire County Council and Staff of the Infirmary met to pay tribute to the fine work accomplished in the past ten years by Matron, Miss M. M. Stringer. Alderman Boushill, Chairman of the Hospital Committee spoke appreciatively of the work done in the Infirmary since its opening, and Mr. H. J. Tillson, Director of Public Assistance, replying, expressed the general gratification felt on the inauguration of the scheme for training assistant nurses. Miss Stringer was presented with a case of beautiful antique silver tea knives, the gift of the staff, and a framed picture from Mr. and Mrs. Tillson. 20 guests were present, many of whom visited the class-room and wards. After tea a concert was held in the nurses' recreation room.

From Scotland

Calling Scottish Midwives

THE Secretary of State for Scotland is appealing for former midwives to continue to do part-time or spare-time work.

New Maternity Accommodation

LANARKSHIRE County Council are to spend £2,000 on additional accommodation for maternity cases at Lockhart hospital.

Profitable Afternoon

AN afternoon bridge and whist drive at Kinnordy House, Kirriemuir, raised over £200 in aid of the nurses pension scheme.

Scottish Gold Medallist

STIRLING Royal Infirmary has awarded their gold medal for the best all round nurse in theory and practice of nursing to Miss R. Kelly.

Health Bill Repercussion

UNTIL the position under the Public Health (Scotland) Bill has been clarified, donors to the proposed maternity block at Irvine Memorial Nursing Home, Pitlochry, have been given the option of having their money refunded or left on deposit in the name of the appeal committee.

Edinburgh Medical Missionary Society

THE superintendents of the Edinburgh Medical Missionary Society for the past eight years, Dr. and Mrs. Lechler have resigned, and their many friends will wish them many happy years in their retirement. Dr. and Mrs. A. Malcolm Kerr are to succeed them in September.

Correspondence

Practical Teaching

I was wondering if you have had any repercussions as the result of the advertisement which appeared recently in *Nursing Times* asking for a sister tutor to teach the practical nursing in the wards! At least, it recognizes one of the most urgent problems in nurse-training, and is an attempt to deal with it, but the thought that this may be considered the solution must fill the hearts of many of us with dismal horror. Surely our reputation for a high standard of practical nursing, which we seemed to enjoy in the past, was dependent on the teaching of bedside nursing by the ward sister! We may use the War as an excuse, if we feel the standard has fallen, and there seems to be general agreement that it has; but even before the War the sister tutor was taking over the responsibility for the practical nursing which had previously been the privilege and duty of the ward sister. Even ten years ago the student nurse was finding that what you did in the wards was a different thing from what you had been taught in the classroom. Now it is not unheard of for the ward staff to say to the student nurse, "Haven't you been shown that in the classroom" instead of, "Let me show you how to do it" As though, in a few weeks, the nurse is able to reach a perfect performance of every skill she will need in the practice of her art, to say nothing of the theoretical side of her teaching in the classroom!

It does not matter how carefully the student nurse is initiated into the art of nursing (and we are only too anxious to take our share in preparing her thoroughly and in teaching methods which are workable and useful in the wards), the perfection of the skills taught in the classroom must take place at the bedside and in the ward under the supervision of someone who has herself attained perfection, and is both willing and able to teach her. I am sure that person ought to be the ward sister. She is a terribly busy person nowadays, with increased administrative and other duties; but why not relieve her of some of these, with secretarial assistance and more trained staff, instead of taking away the training and teaching of the student in practical nursing?

MURIEL B. POWELL.
Manchester Royal Infirmary.

Responsibilty—the Crux

In reference to the correspondence arising from the letter "Who is to Blame" I should like to say that I think Miss Simpson's contact with ward sisters must have been unfortunate and that the type of ward sister she depicts is certainly not in the majority to-day. As a ward sister of 10 years' standing I have not found that sisters of any age, including myself are grudging the student nurse shorter hours, better domestic and study facilities more license and more money.

What we do feel, I think, is that the student nurse of to-day is lacking in a sense of responsibility. This is the crux of the matter. The ward sister shoulders more than her share, and the student nurse "gets away with it." The care of suffering humanity must to some extent weigh rather heavily on those who are responsible. Therefore it is more often than not the student nurse's fault when the ward sister becomes irritable and bad tempered. The student nurse has taken her responsibility too lightly. Ward sisters are willing to teach student nurses, but it is often what they know how to do so well that they do so badly. For instance, it is a nightmare to get a nurse to keep a half-hourly pulse record to time. Failure to record a pulse to time may have serious consequences, but student nurses do not think that it is a serious misdeed, even though they know that it is important.

I think that most ward sisters to-day have a feeling akin to despair, if they are conscientious. We know that the patients' life and well-being is, to a great extent, in our hands. We know that we should be the practical teachers of the student nurse, and we know that we should be the administrators of our wards. We know too well that time is the factor which prevents us from the fullest carrying out of our duties to patient, nurse and ward. Until there is a drastic re-organisation of the system of training I fear this will always be so. In the meanwhile, if the student nurse wants a fair deal from the ward sister, whilst she is on duty, she must give fully, freely, intelligently and conscientiously of her best to her ward sister. I have on occasions thought that if work were so carelessly, badly, thoughtlessly done, and if memory failed so often in any other walk of life, these young people would be cast out as not worth their salt.

I should like to assure the writer "What the very young nurse thinks," that ward sisters do appreciate the girl who is interested, who is willing, and who tries, and we feel that some of our student nurses are worth their weight in gold.

Red tape does not exist in hospital to-day, but the girl of breeding will show a natural courtesy to her superior officers, and good manners do matter in hospital as in every other activity of life. The girl who opens the door to doctor, matron or sister is to my mind being just naturally polite.

C. M. EDWARDS, S.R.N., S.C.M.,
College Member.

The Teacher's Part

I would like to reply to two of the letters printed in the August 10 issue of the *Nursing Times*. With regard to the second year nurse who gives in: N. Wightman writes:—'It is often a thoughtful girl who gives in.' Is it not the thought of increasing responsibility which daunts her? The reluctance to take responsibility is noticeable in nurses to-day. I experienced a tremendous thrill out of responsibility when I was in training, and wild horses would not have got me to say that I could not manage, and I enjoyed it. The harder it was, the more worth while I thought nursing was, and I felt I had achieved something. That feeling seems to be going. You may say, 'About time too!' I disagree, and say that there is something radically wrong with the rising generation. Thank you, Miss Simpson, for the clue. Teachers must then share the blame. Shame on them for allowing slovenly habits! They will be the girls, who, when one is introduced, prop a table or wall up and offer a limp hand—ugh!

Girls are not expected to show respect, you say. This war will have been fought in vain, then, if respect is not even taught. People, countries, treaties will mean nothing. It is a tremendous task we have to do, those who work with young people, to guide their thoughts and actions, help them to realize the joy of living, and giving something to help the community. Everyone should do something to make life better for those who follow, not just think of what they can get.

It is up to the modern nurse to go through with her training, and show how to be a sister without being inhuman. There are no more tyrants and inhuman people in the nursing profession than there are in any other profession or walk of life. Go in to any teachers' common room, students' room, office, factory, there they are. Of course, improvements are wanted in the nursing profession. Every trained nurse, sister and matron wants to see the hours shortened, and it is nonsense to assume that they don't. None of these things will stop wastage, if the 'backbone' of the individual is soft. Nothing in this world, which has been worth doing, has been accomplished by the easy road; it never will be, and who wants it to be? Young nurses, go through with your training and make nursing a still grander profession. It's up to you.

W. WADEY. (College No. 38067.
The Royal East Sussex Hospital,
Hastings.

In Support of the Home Front

I have recently received a Circular from a group of professional nurses, not connected with the Royal College of Nursing, which makes reference to the forthcoming International Conference to be held in America in 1947. There is a sentence in this Circular worded:—"Nursing problems in England seem to be increasing, and we are sure to find help and inspiration from our friends in America."

It made me wonder if we had become so decadent and renegade, that we must talk our woes elsewhere. To me, the well trained British nurse is not unlike the well-made British article, which, when unobtainable, is not easy to replace, or substitute. We are suffering from war aftermath, and must accept the times, but our present system of nursing is not ancient, nor I hope, stagnant.

One reason why the British nurse is a good nurse, is the fact that she is not separated from the bedside during her training. It takes courage to enter a hospital, and it takes courage to return to the bedside, once one has left it, even temporarily. Her competence is also enhanced by her teaching at the bedside. A ward sister recently was nursing a Polish doctor in the ward, and he said to her one day quite unexpectedly, "Sister, I watch you work. I have worked in American and Continental hospitals, but no nurse is so efficient as the British nurse. Her work is complete in all its aspects, and time is never lost." (A blood transfusion apparatus had just been erected.) I trust the identity of the British nurse will never be lost.

The layman has much to say on public and nursing affairs, and has his way of making amends, but in the end, he stands or falls by the article produced. Sickness is misfortune, it demands sacrifice. Our young nurses still have grit and courage, and God does not withhold vision and purpose. I would like to see on the placards, which advertise for nurses to train,—"This work is not without sacrifice." That is the time for the young person to make up her mind. She will find it all the more agreeable, once having taken the plunge. We still have something on the home front; and we should stick fearlessly to our guns.

OBSERVER.

FOR WHIPPS CROSS NURSES

A nurses' league of trained members of Whipps Cross Hospital, Leytonstone, E.11 is being formed. Will those interested please communicate with the honorary secretary.

CITY GENERAL HOSPITAL, PLYMOUTH

Will former nursing staff who qualified for their S.R.N. at the City General Hospital, Plymouth, since 1941, and have not received the medallion, please communicate immediately with the Matron, as the medallions are now available.

PRESENTATION

The Kidderminster Hospital is losing its matron in September, when Mrs. S. E. Stretton, matron for 30 years, retires. The President of the hospital, Mrs. W. M. Weir, asks that donations to a Testimonial Fund should be sent to the House Governor at the hospital, as soon as possible.

Royal College of Nursing News

Membership form may be obtained from the Secretary, Royal College of Nursing 1a, Henrietta Place, Cavendish Square, W.1., or from local Branch Secretaries

Education Department

DIPLOMA IN NURSING

Revision Classes, 1946

The programme of revision classes for the Diploma in Nursing examination, 1946, is as follows :—

Tuesday, *September 24, October 1, 8 and 15,* 6—7 p.m. Physiology, 7—8 p.m. Chemistry and Physics.

Thursdays, *September 26, October 3, 10 and 17,* 6—7 p.m. General Psychology. *September 26 and October 3,* 7—8 p.m. Hygiene ; *October 10 and 17,* 7—8 p.m., Anatomy.

Fees : *For the Full Course.*—College members, 2 guineas ; non-members, 3 guineas. *For a Single Class.*—College Members, 3s. 6d. ; non-members, 5s.

Application should be made to the Director in the Education Department, Royal College of Nursing, 1a, Henrietta Place, Cavendish Square, London, W.1.

Scottish Board

Refresher Course for Public Health Nurses

Lectures in the course to be held in Glasgow from September 9 to 13, 1946, will be open to any State-registered Nurse. Visits will be reserved mainly for Public Health Nurses, but a limited number of vacancies will be open to other nurses after **Thursday, August 29.** Programme and application form may be obtained from the Acting Secretary, Royal College of Nursing, Scottish Board, 40, Melville Street, Edinburgh, 3. Application should be made as soon as possible if first choice in visits is desired. **The programme was published in the *Nursing Times* of July 13, p. 541.**

Branch Reports

Brighton and Hove Branch.—A whist drive will be held on Saturday, September 28 at 2.30 p.m. at the New Sussex Hospital, Brighton, by kind permission of Miss Saunders, (matron). All college members and their friends will be welcome.

Coventry Branch.—A motor-coach excursion has been arranged to Oxford on Saturday, September 7, 1946. Coaches leave the Baths, Priory Road, Pool Meadow, 12.30 p.m. prompt. Fare is 8s. 6d. Tea 2s. and a guide around Colleges, 1s. Please notify Mrs. Kendall, 82, Church Lane, Stoke, Coventry, of the number of seats required. Please apply at once.

Manchester Branch.—A meeting of the Manchester Branch of the Royal College of Nursing was held on Thursday evening, July 4 at Salford Royal Hospital, by kind permission of the matron, Miss Bell, who took the Chair. The speaker was Alderman Mrs. Kemball (late Mayor of Eccles), whose subject was " The Welfare of the Aged, with Special Reference to the Chronic Sick." After discussion and questions, votes of thanks to Mrs. Kemball and Miss Bell were proposed by Miss Hillier. Refreshments prefaced the general business meeting, which followed. The next meeting will take place on Tuesday, September 3, at 6.30 p.m. at Monsall Hospital by kind permission of Miss Orchardson, when Dr. Liddle will give a lecture on " Penicillin." The honorary secretary, Miss M. G. E. Fyson, Carfax, Lower Park Road, Victoria Park, Manchester, 14, apologises for unavoidable delay in sending out the new Syllabus, members will be receiving one in due course.

NURSES' APPEAL FOR NURSES

Nation's Fund for Nurses

When adding up our total of £10,722 19s. 0d. to-day we thought it would be interesting to know exactly how much we owe " to date " to our regular donors, then we realized that the kind remembering and many sacrifices made to save the donations, the time spent in queues to buy the postal orders and in going to the letter box were things which no one could estimate so we decided just to be grateful. We would be so pleased to see new names on the list of monthly and yearly contributors.

Donations for the Week ending August 17, 1946

	£	s.	d.
Matron and nursing staff, Royal Berkshire Hospital (monthly donation)		10	0
Matron and nursing staff, Royal Halifax Infirmary (monthly donation)	8	0	0
" S.R.N.," Devon (monthly donation)		1	0
Miss Gregory (monthly donation)		2	6
Miss Gregory (for a holiday for an elderly nurse)	1	0	0
E. L. (for a holiday for an elderly nurse) ...	2	0	0
Miss Helson		10	0
Miss Whitley		5	0
Miss Tabb		6	0
College Member, No. 37959		5	0
Total ...	**£12**	**19**	**6**
Total to date	**£10,722**	**19**	**0**

We are very grateful to Mrs. Hosford, Miss L. Wealthall and Miss M. A. Shakspeare for parcels of clothing; to Miss E. Lewington, Miss Callard and friends and an anonymous donor for stamps, to Miss Callard and friends for tinfoil.

E. N. Price, Secretary, Nurses' Appeal Committee, **Royal College of Nursing, 1a, Henrietta Place, Cavendish Square, London, W.1.**

EXAMINATION RESULTS

INDUSTRIAL NURSING EXAMINATION

July 1946, Belfast and Glasgow

The following have gained the Industrial Nursing Certificate of the Royal College of Nursing :—

Distinction in whole examination.—I. N. King.

Pass in the Health of the Industrial Worker, the Work, of the Nurse in Industry and the Modern Industrial System.—Devenney, K. H., Freeland, S. S.; Galbraith, I. M.; Jackson, E. J.; Leedham, C. M.; Meeham, M. A.; Mulree, I. K.; McLachlan, A. C.; Porter, K. M.; Rose, E.; Sheppard, M. A.; Totten, S. D.

Pass in the Health of the Industrial Worker and the Work of the Nurse in Industry.—Balmer, S. I.; Walker, H. E. K.

Note.—Owing to difficulties with printing the certificates may not be sent out for several months.

IMPORTANT PENICILLIN ANNOUNCEMENT

Glaxo Laboratories, Ltd., tell us that they are receiving " immense numbers " of requests from nurses asking them to supply them with penicillin. It seems that many nurses are under the impression that this drug is available without a medical prescription. This is quite erroneous, and the manufacturers will be glad if our readers will correct of their colleagues who are under this mistaken impression.

Below : *Miss E. Sambrook, S.R.N., S.C.M., Diploma in Nursing, University of London*

Coming Events

The Society of Registered Male Nurses.—There will be a meeting of the society at the Royal College of Nursing on August 28, 1946, at 6.30 p.m.

County Hospital, Pembury, Nr. Tunbridge Wells.—The nurses' annual re-union and prize-giving will take place in the nurses' home on Thursday, September 26, 1946, at 3 p m., all past members of the staff will be welcome.

Kent County Council.—The fifteenth post-certificate course for midwives will be held from September 16 to 20 at the County Hall, Maidstone. Lecturers will include Miss Meave Kenny, M.B., B.S., M.R.C.S., L.R.C.P., F.R.C.O.G., who will speak on " Puerperal Sepsis, its Cause, Prevention and Treatment," A. White Franklin, Esq., M.A., M.B., B.Ch., F.R.C.P., who will speak on " Neo-Natal Infections, their Causes, Prevention and Treatment " ; and Professor F. J. Browne, M.D., D.Sc., F.R.C.S. (Ed.), F.R.C.O.G., who will speak on " Toxaemia of Pregnancy." Full programme and further details may be obtained from the County Medical Officer, Public Health Department, County Hall, Maidstone, Kent.

The Nutrition Society.—A scientific conference will be held on Saturday, September 21, at 10.30 a.m. The subject will be " The Work and Aims of the Food and Agriculture Organization," and Sir John Orr will be one of the speakers. Non-members must be introduced by a member unless they belong to a society which has been notified that its members may attend.

Morley College for Working Men and Women, 61, Westminster Bridge Road, S.E.1.—Two 24 lecture courses dealing with Child Care and Child Psychology will be given by Miss Caroline Sharp at Morley College in the new session, opening on September 23. The first (on Fridays from 3 to 5 p.m.) is entitled *The Institution Child*, and is planned for those concerned with boys and girls deprived of ordinary home life. The second (on Tuesdays from 6.30 to 8 p.m.) is a course for parents and teachers dealing with the many aspects of the normal development of children. Full particulars can be obtained from the Secretary.

Weymouth and District Hospital.—The first prizegiving and re-union, and the opening of the nurses' new teaching unit, will take place on August 31 at 3 p.m. All past members of the nursing staff are invited, R.S.V.P. to Matron if hospitality is required for the night.

Institute for the Scientific Treatment of Delinquency.—12 lectures on " The Psychology of Delinquency " by Dr. Alan Maberly, as part of the University of London Extension Courses will be held on Wednesday evenings at 7 p.m., beginning October 2. Fee £1. Full details are obtainable from General Secretary, Institute for the Scientific Treatment of Delinquency, 8, Bourdon Street, Davies Street, W.1 (Mayfair 0632-3).

A NEW SECRETARY

Student nurses will be happy to welcome their new secretary, Miss Eileen Sambrook, who has recently been appointed to follow Mrs. Stocken, the previous secretary. Miss Sambrook comes to them with wide experience. A trainee of Guy's Hospital, where she has also been a ward sister, assistant home, assistant sister tutor and office sister. Miss Sambrook is also an old " International " student, has been a sister in the Territorial Army Nursing Service, and was for some time the assistant editor of the *Nursing Times*. She has always been extremely interested in the student nurse, and will undoubtedly continue to make the Student Nurses Association the very active and virile section it has proved itself to be in the past.

ABOUT OURSELVES

Prizewinners at Southend General Hospital with matron, Miss I. M. L. Sayer (centre) and sister tutors

Prize Day at Southend

Although it was dull and windy outside, the interior of the Southend General Hospital was bright and gay for its prize-giving last Saturday. The prizes were awarded by the Countess of Radnor, a Vice-President of the Royal College of Nursing, who supported Mr. Chalton Hubbard, J.P., in his appeal for more nurses to keep up the high standard for which the hospital was famed. He appealed mainly to the Southend girls, who, he said, would find the hospital "home from home." Miss I. M. Sayer, matron, praised the nurses for their good work during a difficult time. Loud applause greeted Miss Patricia M. Barnes, who received the Hubbard Gold Medal, having obtained 78 per cent. of all marks during her three years' training. Miss J. Webster was awarded the Saunders Silver Medal with a 76 percentage. Other awards and certificates were presented as follows :—*Surgical Nursing.*—Miss J. Wright. *Medical nursing.*—Miss D. Lowe. *Practical nursing.*—Miss P. Barnes. *First year examination.*—Miss J. Noxon and Miss B. Jones. *Final examination.*—Miss S. Anderson, Miss Q. Valentine and Miss J. Webster. *First year examinations.*—Miss J. Bonnick, Miss D. Lawrence, Miss K. Hall, and Miss K. Mathie. *Merit prizes : Junior special.*—Miss H. Stewart. *1st year.*—Miss Maud Charters. *2nd year.*—Miss H. Harper. *3rd year.*—Miss I. Gilbert. *4th year.*—Miss F. Webb.

Anniversary Celebrations at Margate

The Royal Sea-Bathing Hospital at Margate recently celebrated its 150th anniversary when Her Royal Highness, Princess Alice, Countess of Athlone, accompanied by the Rt. Hon. The Earl of Athlone, President of the Hospital since 1908, was entertained to luncheon at the hospital. A Service of Thanksgiving, conducted by the Bishop of Dover, preceded a visit to the children's ward, where an eight years' old patient, Doreen Tipping, presented a bouquet to Princess Alice. Presentations were made to Miss Hardeman, home sister, and Miss Hogg, night sister, in recognition of long and valued services to the hospital extending over periods of 24 and 22 years respectively. Opened on July 20, 1796, with a complement of 16 beds, the hospital to-day has accommodation for 320 patients.

Prize-giving at the Miller General Hospital, S.E.10

A happy ceremony took place recently in the nurses' home, at the Miller General Hospital, S.E.10, when Miss M. J. Smyth, Matron of St. Thomas's Hospital, presented medals and prizes. The gold medallist was Mrs. M. Fenn (Miss Stirling), other prize-winners were :—Miss B. Kent, Miss O. Mace, Miss D. Stevens (3 prizes), Miss G. Way, Miss M. Vincent, Miss D. Fairlie, Miss N. Stanton, Miss M. Churchouse, Miss G. Butcher, Miss D. Allister, Miss J. Butement. Miss Smyth was presented with a charming bouquet and Miss Marsh, matron, also received a bouquet in recognition of the eighteenth anniversary of her matronship. The nurses re-union followed and was very well attended by past members of the nursing staff.

KENT COUNTY COUNCIL
STUDENT NURSES—TUBERCULOSIS AND GENERAL TRAINING

The opportunity is offered to women and girls to undertake combined training for the examination of the Tuberculosis Association and the State General Nursing examination. The training in Tuberculosis Nursing and the Preliminary State examinations in General Nursing is provided by a two years' course at either the County Hospital, Lenham, or the Kettlewell Hospital, Swanley. Students will then continue their general training for further two years and qualify to sit for the final examination of the General Nursing Board at either the County Hospital, Farnborough, or the County Hospital, Pembury, at which these hospitals are affiliated. The salary is at the rate of £60, £70, £75 and £80 a year, respectively, for the first, second, third and fourth years.

In addition board residence, laundry and uniform are provided at each hospital and the posts are superannuable.

Experienced nurses holding this dual qualification are eligible for higher Tuberculosis nursing appointments.

THE WORK IS OF VITAL NATIONAL IMPORTANCE.

Further particulars and forms of application are obtainable from the Matron at either hospital (Lenham or Kettlewell) to whom completed applications should be sent.

County Hall, W. L. PLATTS,

Advice on Pre-natal care

'Bisurated' Magnesia is a reliable antacid for relieving the heartburn and nausea which so often come with pregnancy; it is an efficient corrective of the excess acidity which frequently causes digestive disorders. It is particularly efficacious where a non-laxative preparation is desirable. You can confidently recommend it to your patients.

• • •

All chemists stock 'Bisurated' Magnesia in tablet or powder form, prices 1/5 and 2/10, including tax.

Bottled Vegetables for Babies—*ready-strained*

Strained Carrots / **Strained Spinach** — *Cooked and packed in vacuum*

As you know, strained vegetables are an essential item in every baby's diet as soon as he is four or five months old. Brand's ready-strained vegetables, specially grown and picked at their prime, are superior to home-cooked vegetables, for they are:

Steam-cooked in vacuum and packed in vacuum, which conserves their natural goodness.

So finely sieved that not a particle of irritant fibre remains.

Busy young mothers will welcome being told about these Baby Foods prepared by Brand & Co. Ltd., and you can recommend them with complete confidence. They are not only better for babies than home-prepared vegetables, but they cut out a tedious job and save a mother's precious time. 7½d. a bottle.

Other varieties are: Bone and Vegetable Broth, Strained Prunes
